

# Ocean data assimilation

WAPE/MOCIS master's program  
February 4, 2025

Emmanuel COSME  
Université Grenoble Alpes, IGE, Grenoble

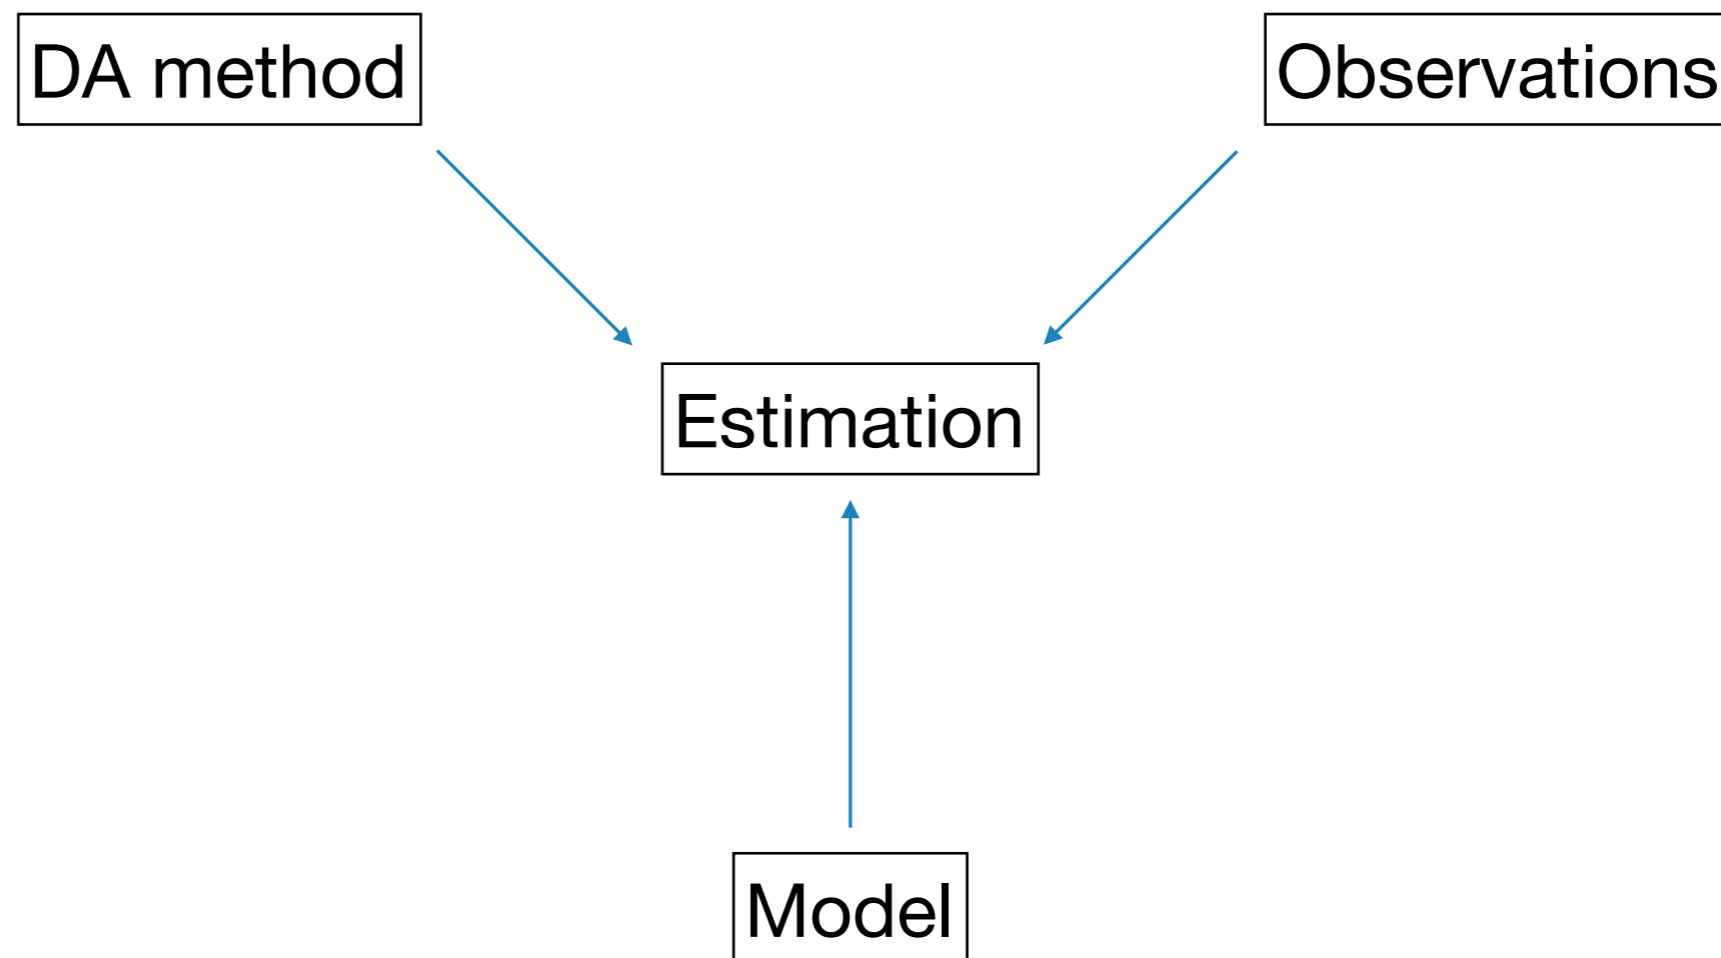

# Scope of the lecture

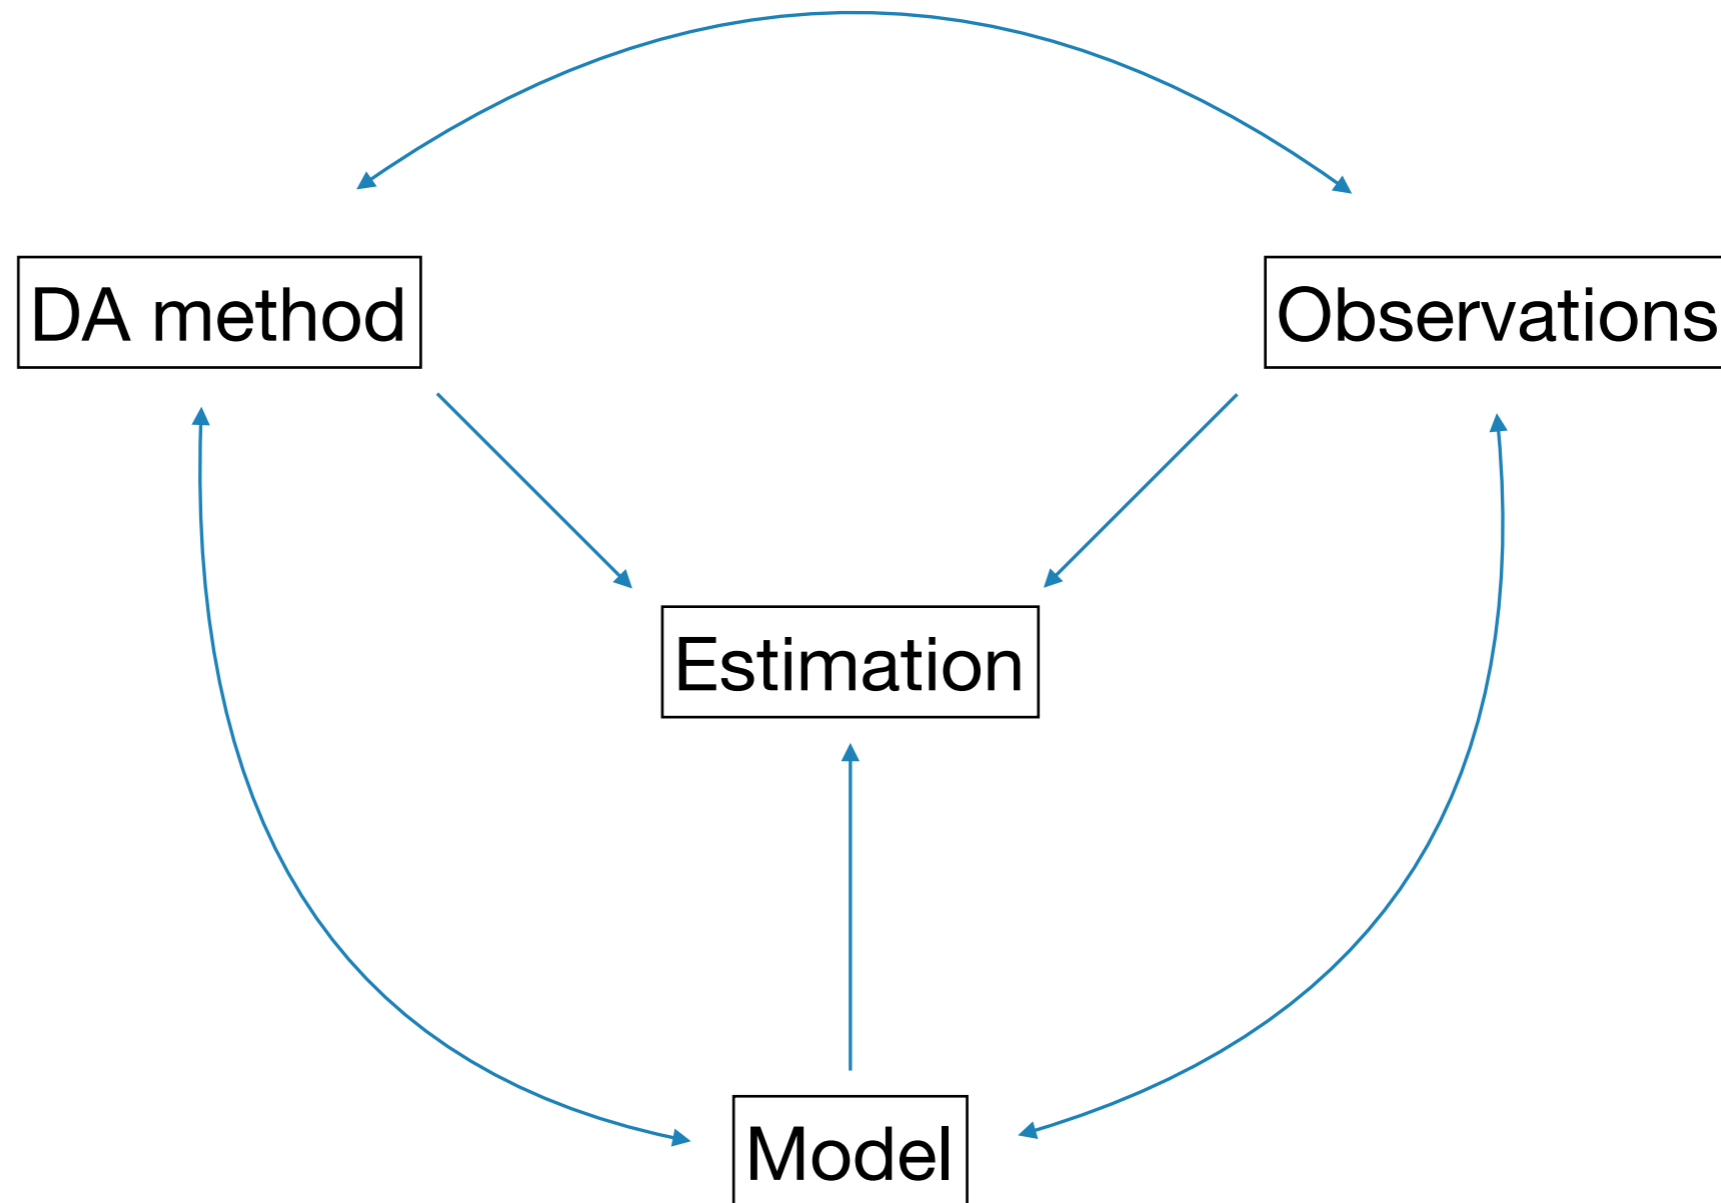

## Texte du titre

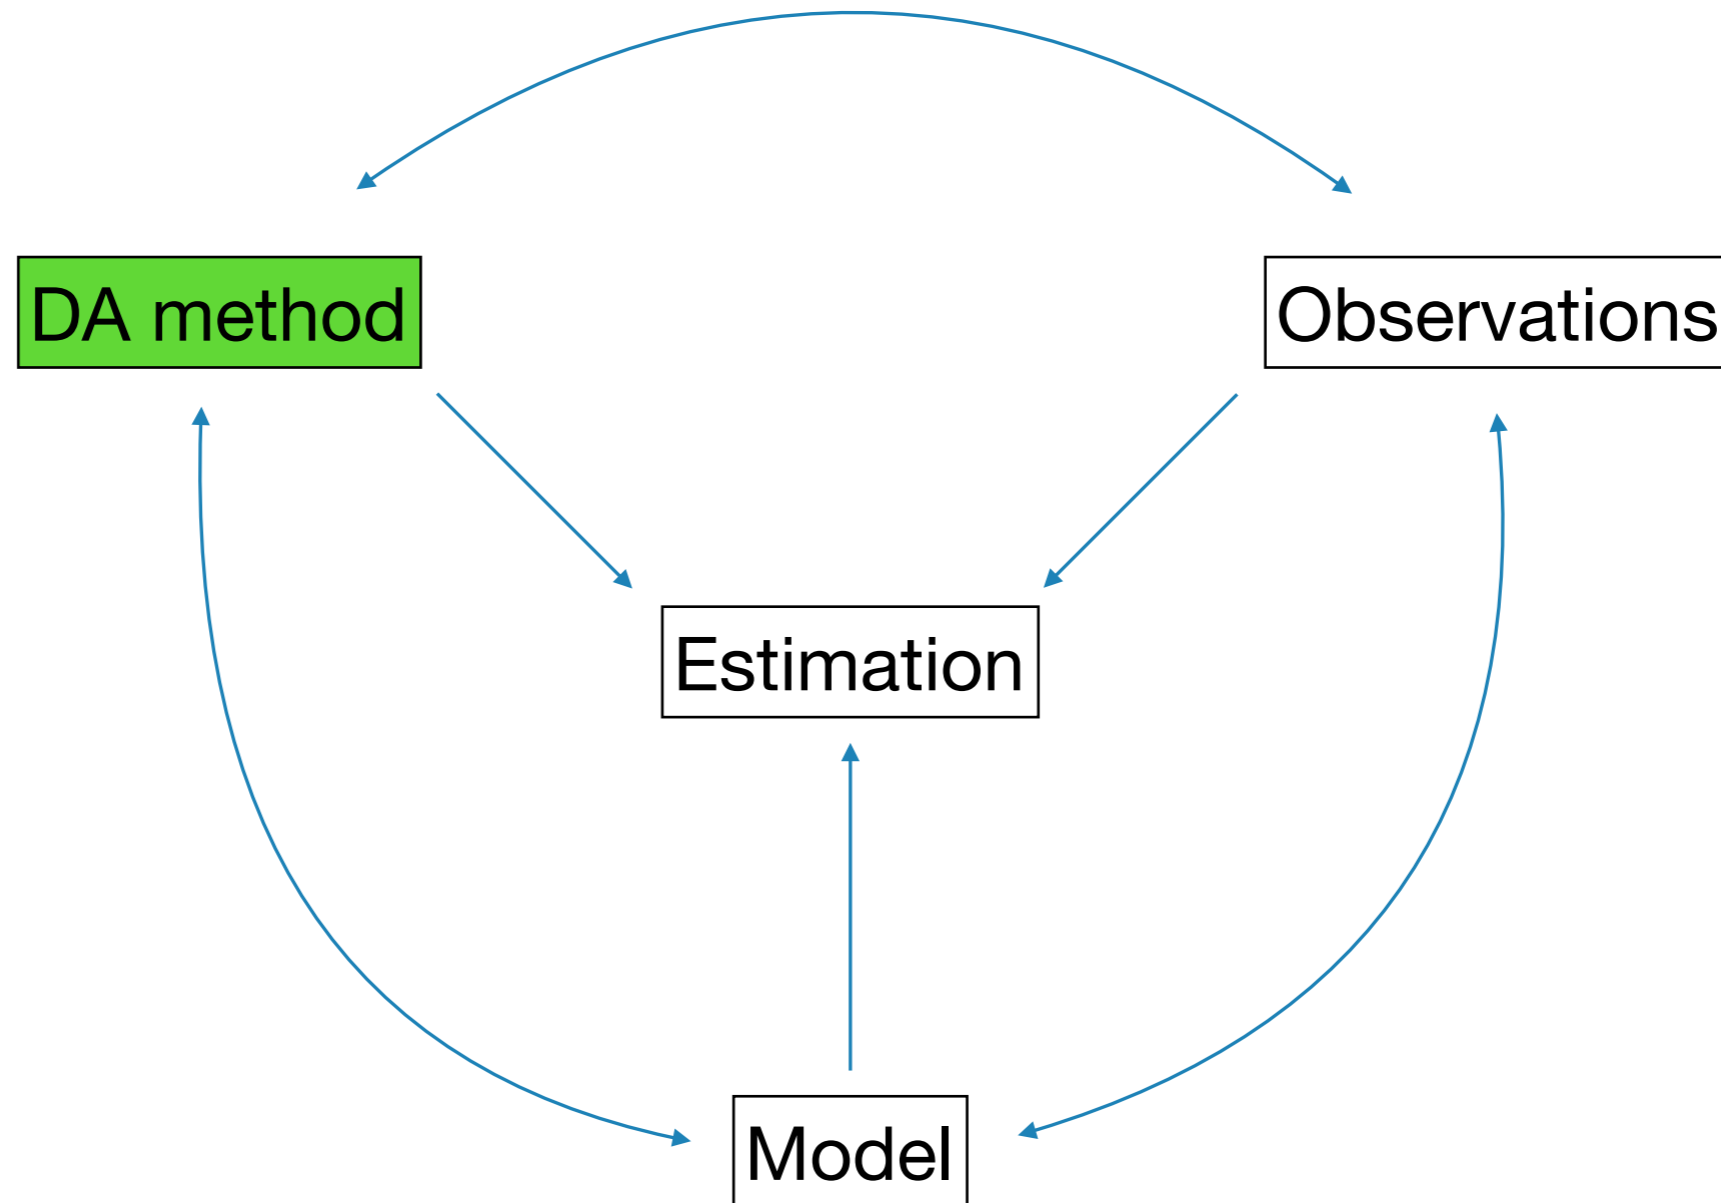

This DA lecture mostly deals with physical oceanography and the ocean circulation, but does not address:

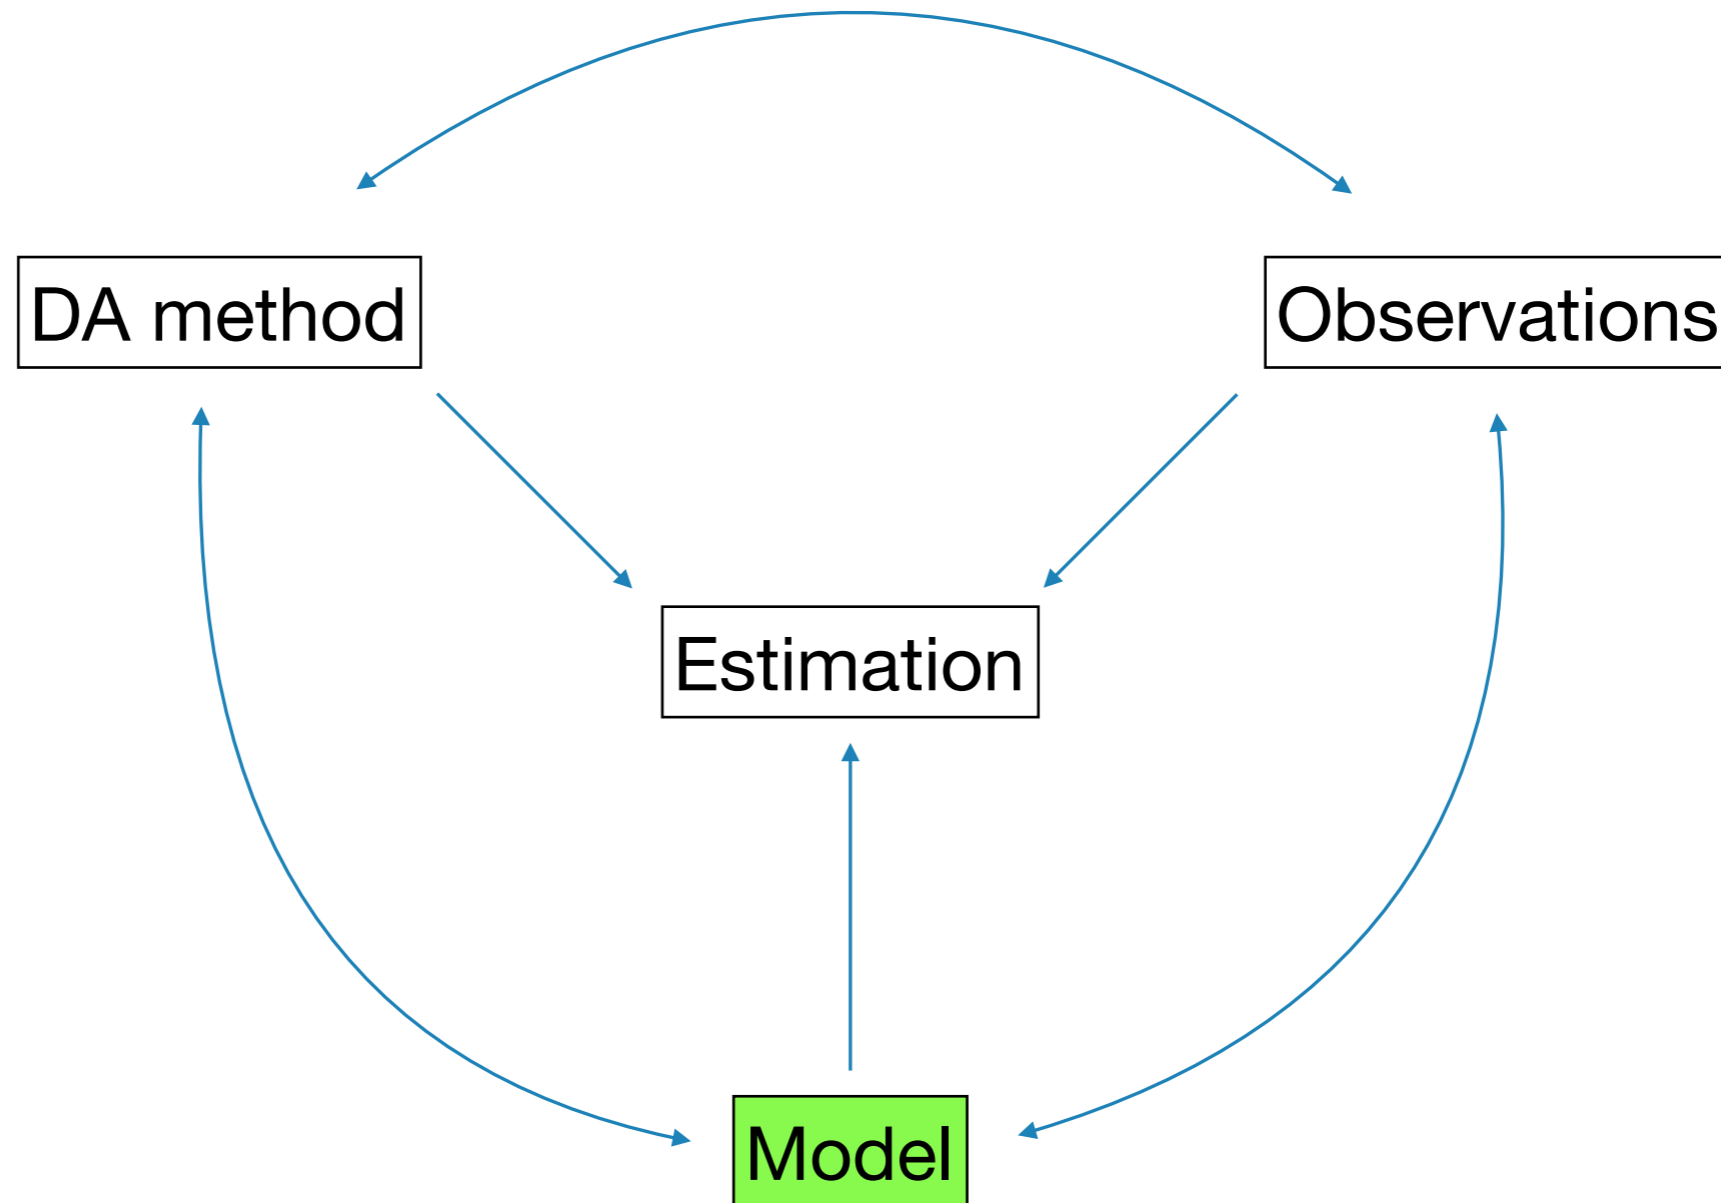

- ocean wave forecasting
- tidal/storm surge forecasting
- ocean chemistry and water quality
- Fish, whales, sharks, jellyfish...

The slides are designed to be more or less "self-sufficient"  
==> wordy sometimes, not extremely fluent

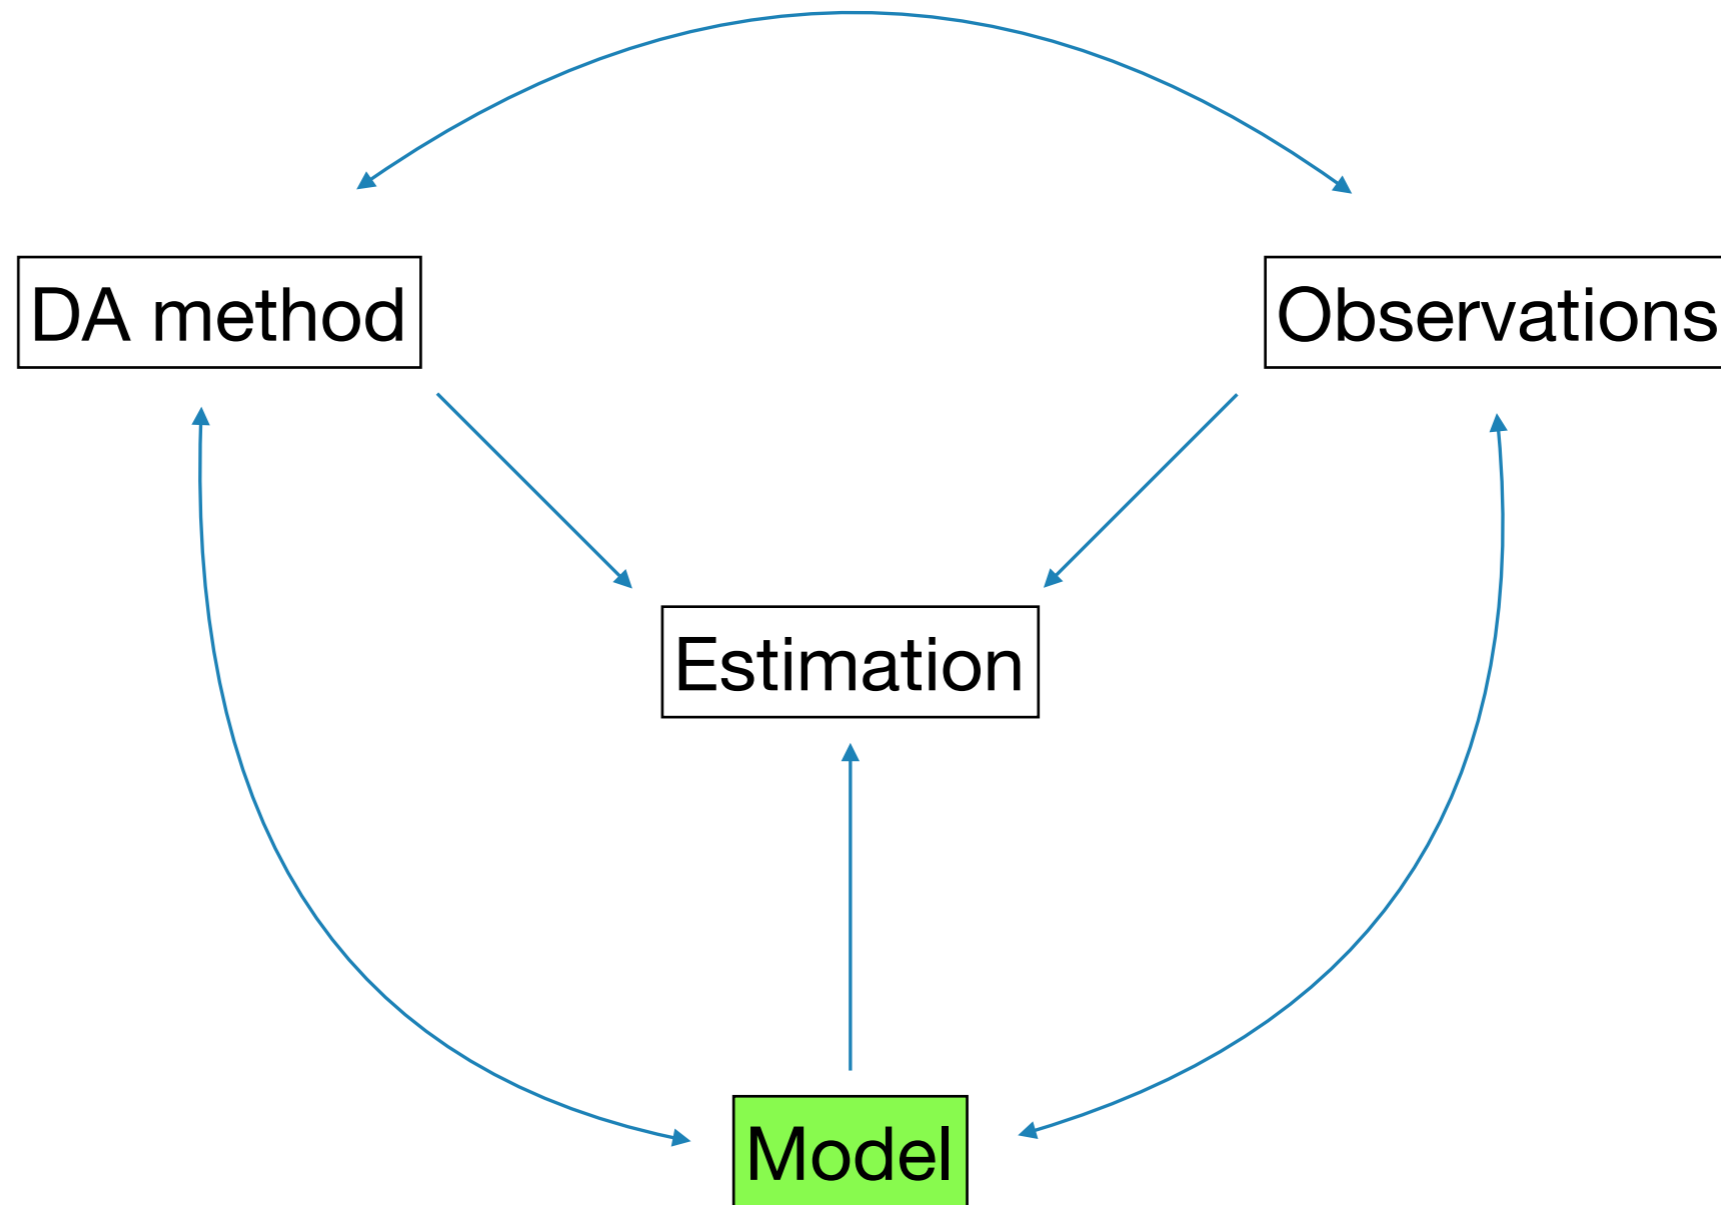

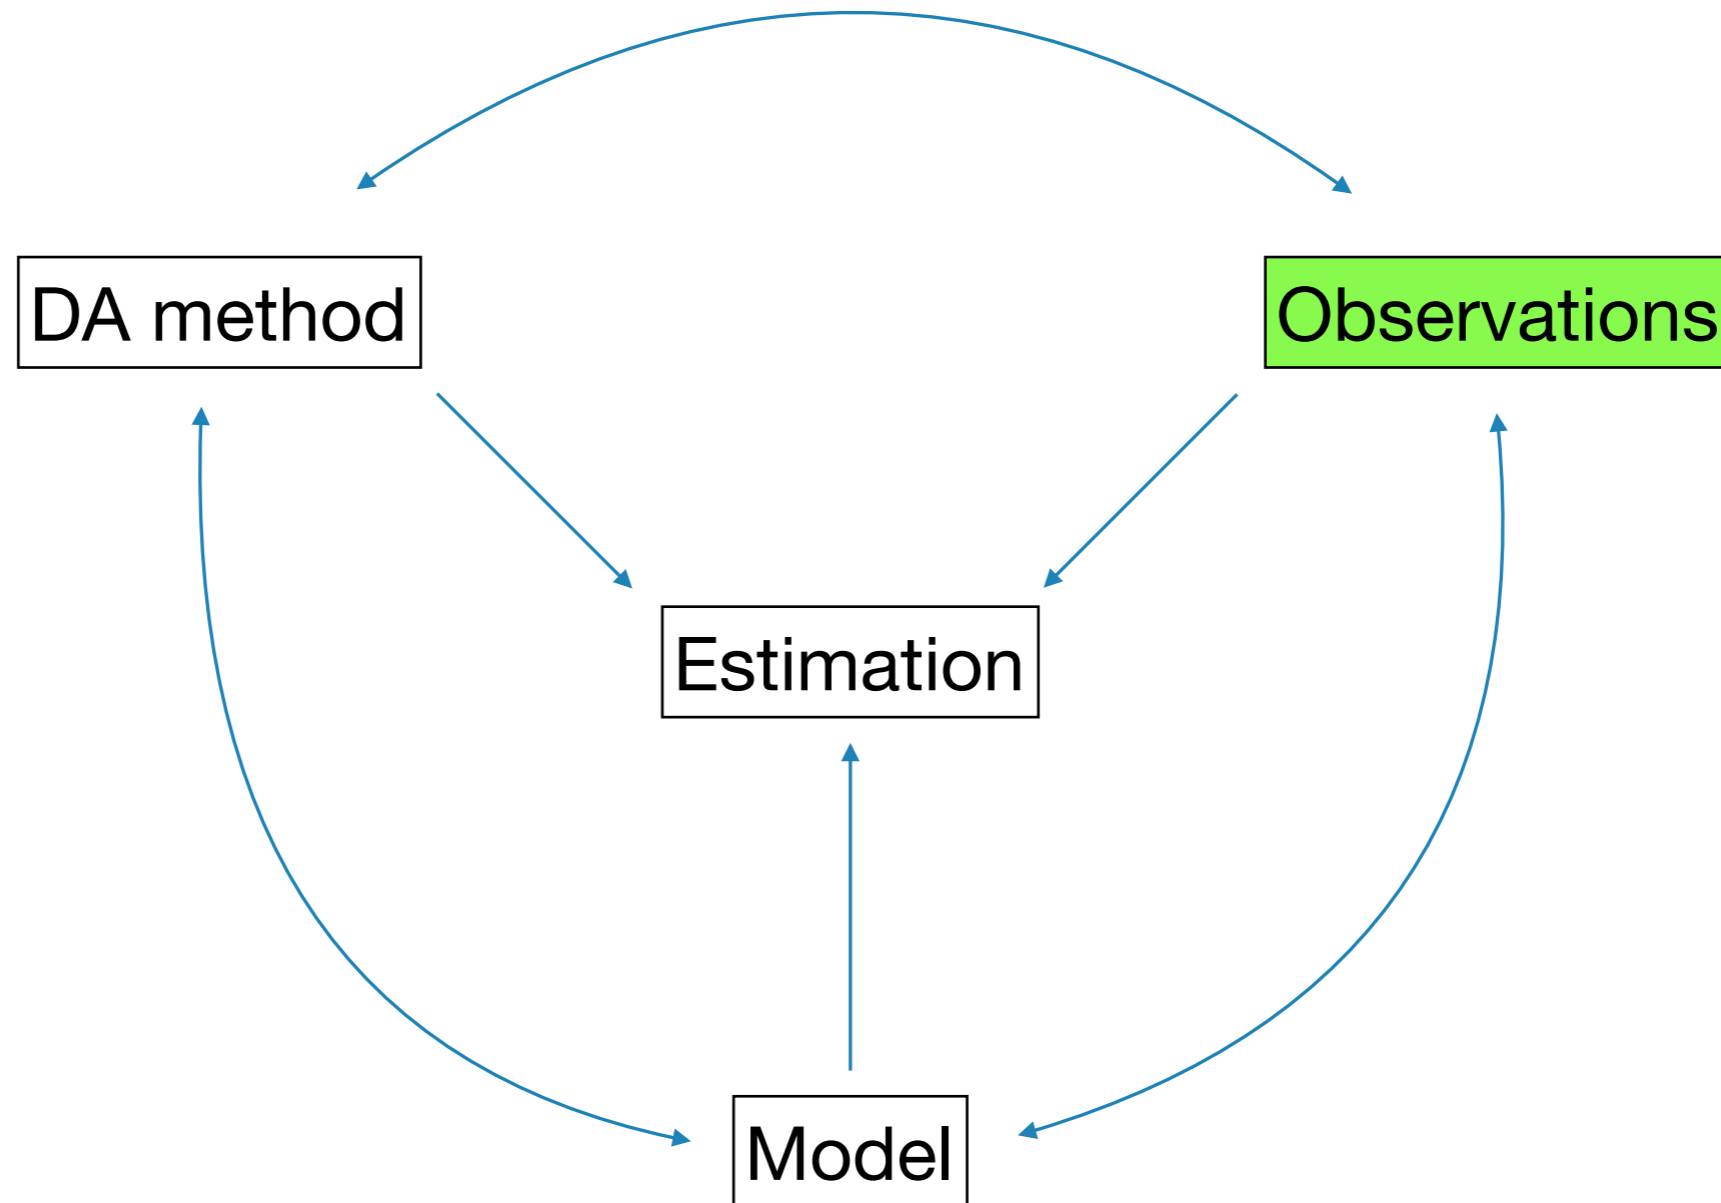

# Motivation for data assimilation

Texte du titre

"Operational" approach

"Observation-centered" approach

1. Atmospheric vs oceanic data assimilation
  - 1.1. History and culture
  - 1.2. Observations
  - 1.3. Dynamics and models
  
2. "Model-centered" data assimilation
  - 2.1. Operational oceanography
  - 2.2. Ocean models
  - 2.3. Observations of the ocean
  - 2.4. Ensemble Kalman filter implementations
  
3. "Observation-centered" data assimilation
  - 3.1. Assimilation of images
  - 3.2. Altimetric products and the SWOT mission
  - 3.3. Mapping balanced motions with a nudging technique
  - 3.4. Eddy/wave separation with a 4DVar technique

### **1. Atmospheric vs oceanic data assimilation**

**Meteorology:**

**Oceanography:**

### Meteorology:

- strong and historical rooting in forecasting issues

### Oceanography:

- Forecasting is an issue, but not the only one (importance of observation-centered DA)

### Meteorology:

- strong and historical rooting in forecasting issues
- the most advanced field for high-dim. DA

### Oceanography:

- Forecasting is an issue, but not the only one (importance of observation-centered DA)
- less maturity than in meteorology

### Meteorology:

- strong and historical rooting in forecasting issues
- the most advanced field for high-dim. DA
- Dedicated manpower

### Oceanography:

- Forecasting is an issue, but not the only one (importance of observation-centered DA)
- less maturity than in meteorology
- much less manpower

### Meteorology:

- strong and historical rooting in forecasting issues
- the most advanced field for high-dim. DA
- Dedicated manpower
- DA is culturally accepted

### Oceanography:

- Forecasting is an issue, but not the only one (importance of observation-centered DA)
- less maturity than in meteorology
- much less manpower
- DA is always questioned

## Illustration: maps of SSH

If a user needs a time series of global maps of Sea Level pressure, what will her choice be?

## Illustration: maps of SSH

If a user needs a time series of global maps of Sea Level pressure, what will her choice be?

*An ECMWF reanalysis, probably.*

## Illustration: maps of SSH

If a user needs a time series of global maps of Sea Level pressure, what will her choice be?

*An ECMWF reanalysis, probably.*

If a user needs a time series of global maps of SSH, what will her choice be?

## Illustration: maps of SSH

If a user needs a time series of global maps of Sea Level pressure, what will her choice be?

*An ECMWF reanalysis, probably.*

If a user needs a time series of global maps of SSH, what will her choice be?

*DUACS products are the most widely used by oceanographers. Until 2024, they were made from nadir altimeter data with a space-time linear interpolation.*

**Meteorology:**

**Oceanography:**

### Meteorology:

- Large number of observations

### Oceanography:

- Comparatively small number of observations

### Meteorology:

- Large number of observations
- Satellite observations are 3D

### Oceanography:

- Comparatively small number of observations
- Satellite observations are 2D

### Meteorology:

- Large number of observations
- Satellite observations are 3D
- Very often, observation operators are complex

### Oceanography:

- Comparatively small number of observations
- Satellite observations are 2D
- Very often, observation operators are simple

# Atmospheric vs oceanic data assimilation

## Dynamics and models

Phenomenon	Length scale $L$	Velocity scale $U$	Time scale $T$
<i>Atmosphere:</i>			
Sea breeze	5–50 km	1–10 m/s	12 h
Mountain waves	10–100 km	1–20 m/s	Days
Weather patterns	100–5000 km	1–50 m/s	Days to weeks
Prevailing winds	Global	5–50 m/s	Seasons to years
Climatic variations	Global	1–50 m/s	Decades and beyond
<i>Ocean:</i>			
Internal waves	1–20 km	0.05–0.5 m/s	Minutes to hours
Coastal upwelling	1–10 km	0.1–1 m/s	Several days
Large eddies, fronts	10–200 km	0.1–1 m/s	Days to weeks
Major currents	50–500 km	0.5–2 m/s	Weeks to seasons
Large-scale gyres	Basin scale	0.01–0.1 m/s	Decades and beyond

## Dynamics and models

The scales particularly relevant for weather predictions and important for climate require more/finer observations in the ocean.

Phenomenon	Length scale $L$	Velocity scale $U$	Time scale $T$
<i>Atmosphere:</i>			
Sea breeze	5–50 km	1–10 m/s	12 h
Mountain waves	10–100 km	1–20 m/s	Days
Weather patterns	100–5000 km	1–50 m/s	Days to weeks
Prevailing winds	Global	5–50 m/s	Seasons to years
Climatic variations	Global	1–50 m/s	Decades and beyond
<i>Ocean:</i>			
Internal waves	1–20 km	0.05–0.5 m/s	Minutes to hours
Coastal upwelling	1–10 km	0.1–1 m/s	Several days
Large eddies, fronts	10–200 km	0.1–1 m/s	Days to weeks
Major currents	50–500 km	0.5–2 m/s	Weeks to seasons
Large-scale gyres	Basin scale	0.01–0.1 m/s	Decades and beyond

- \* The scale of eddies is set by the Rossby radius of deformation:

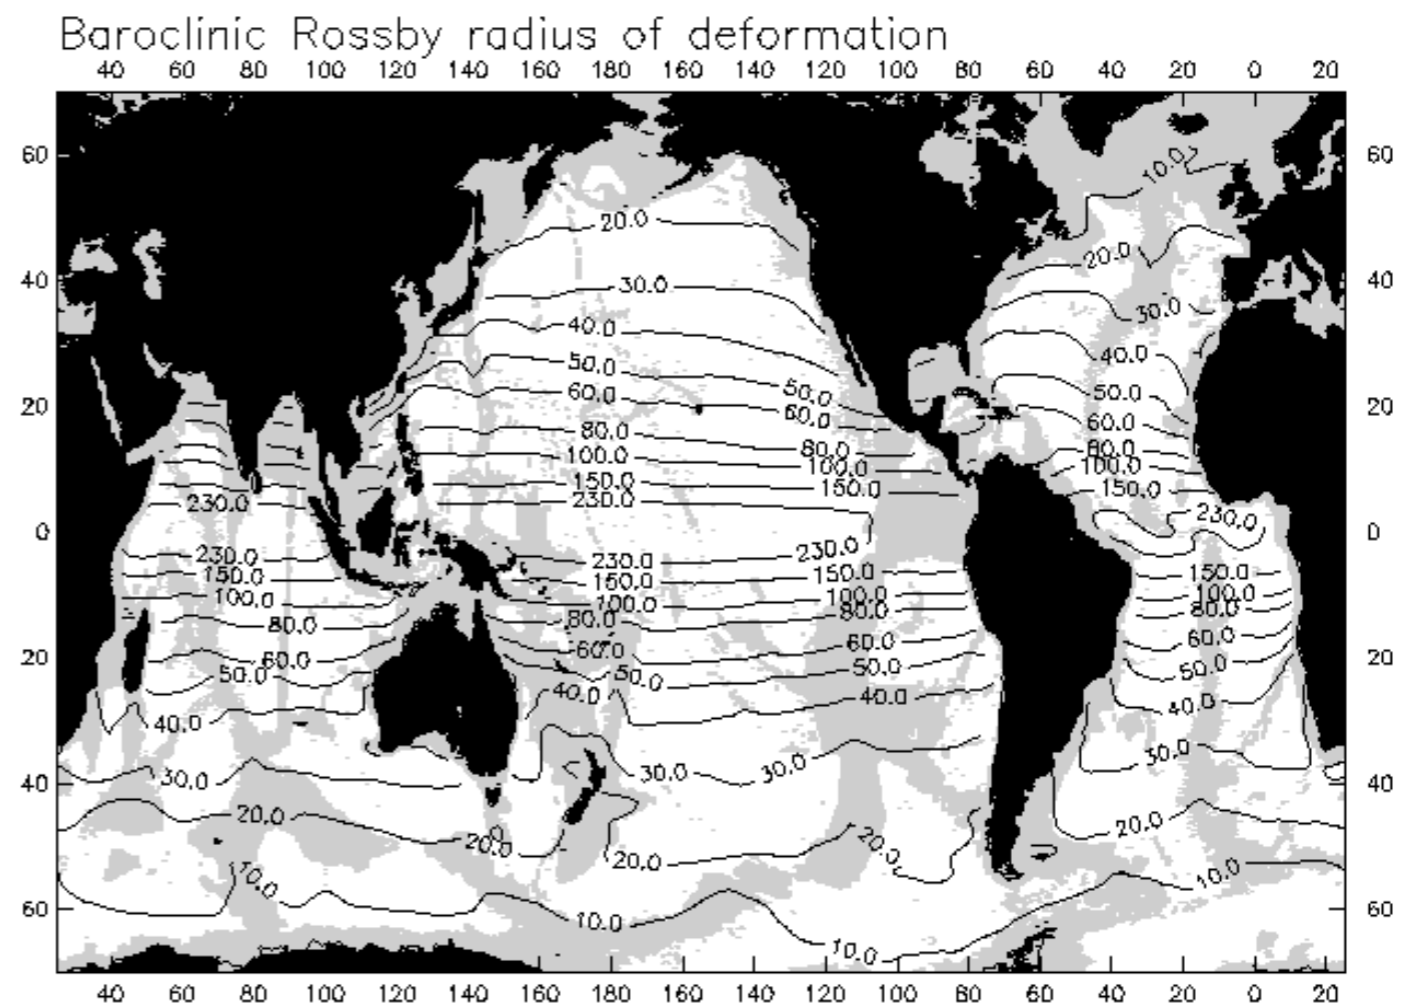

$$L_\rho = \frac{NH}{2\Omega}$$

N: Brunt-Väisälä frequency

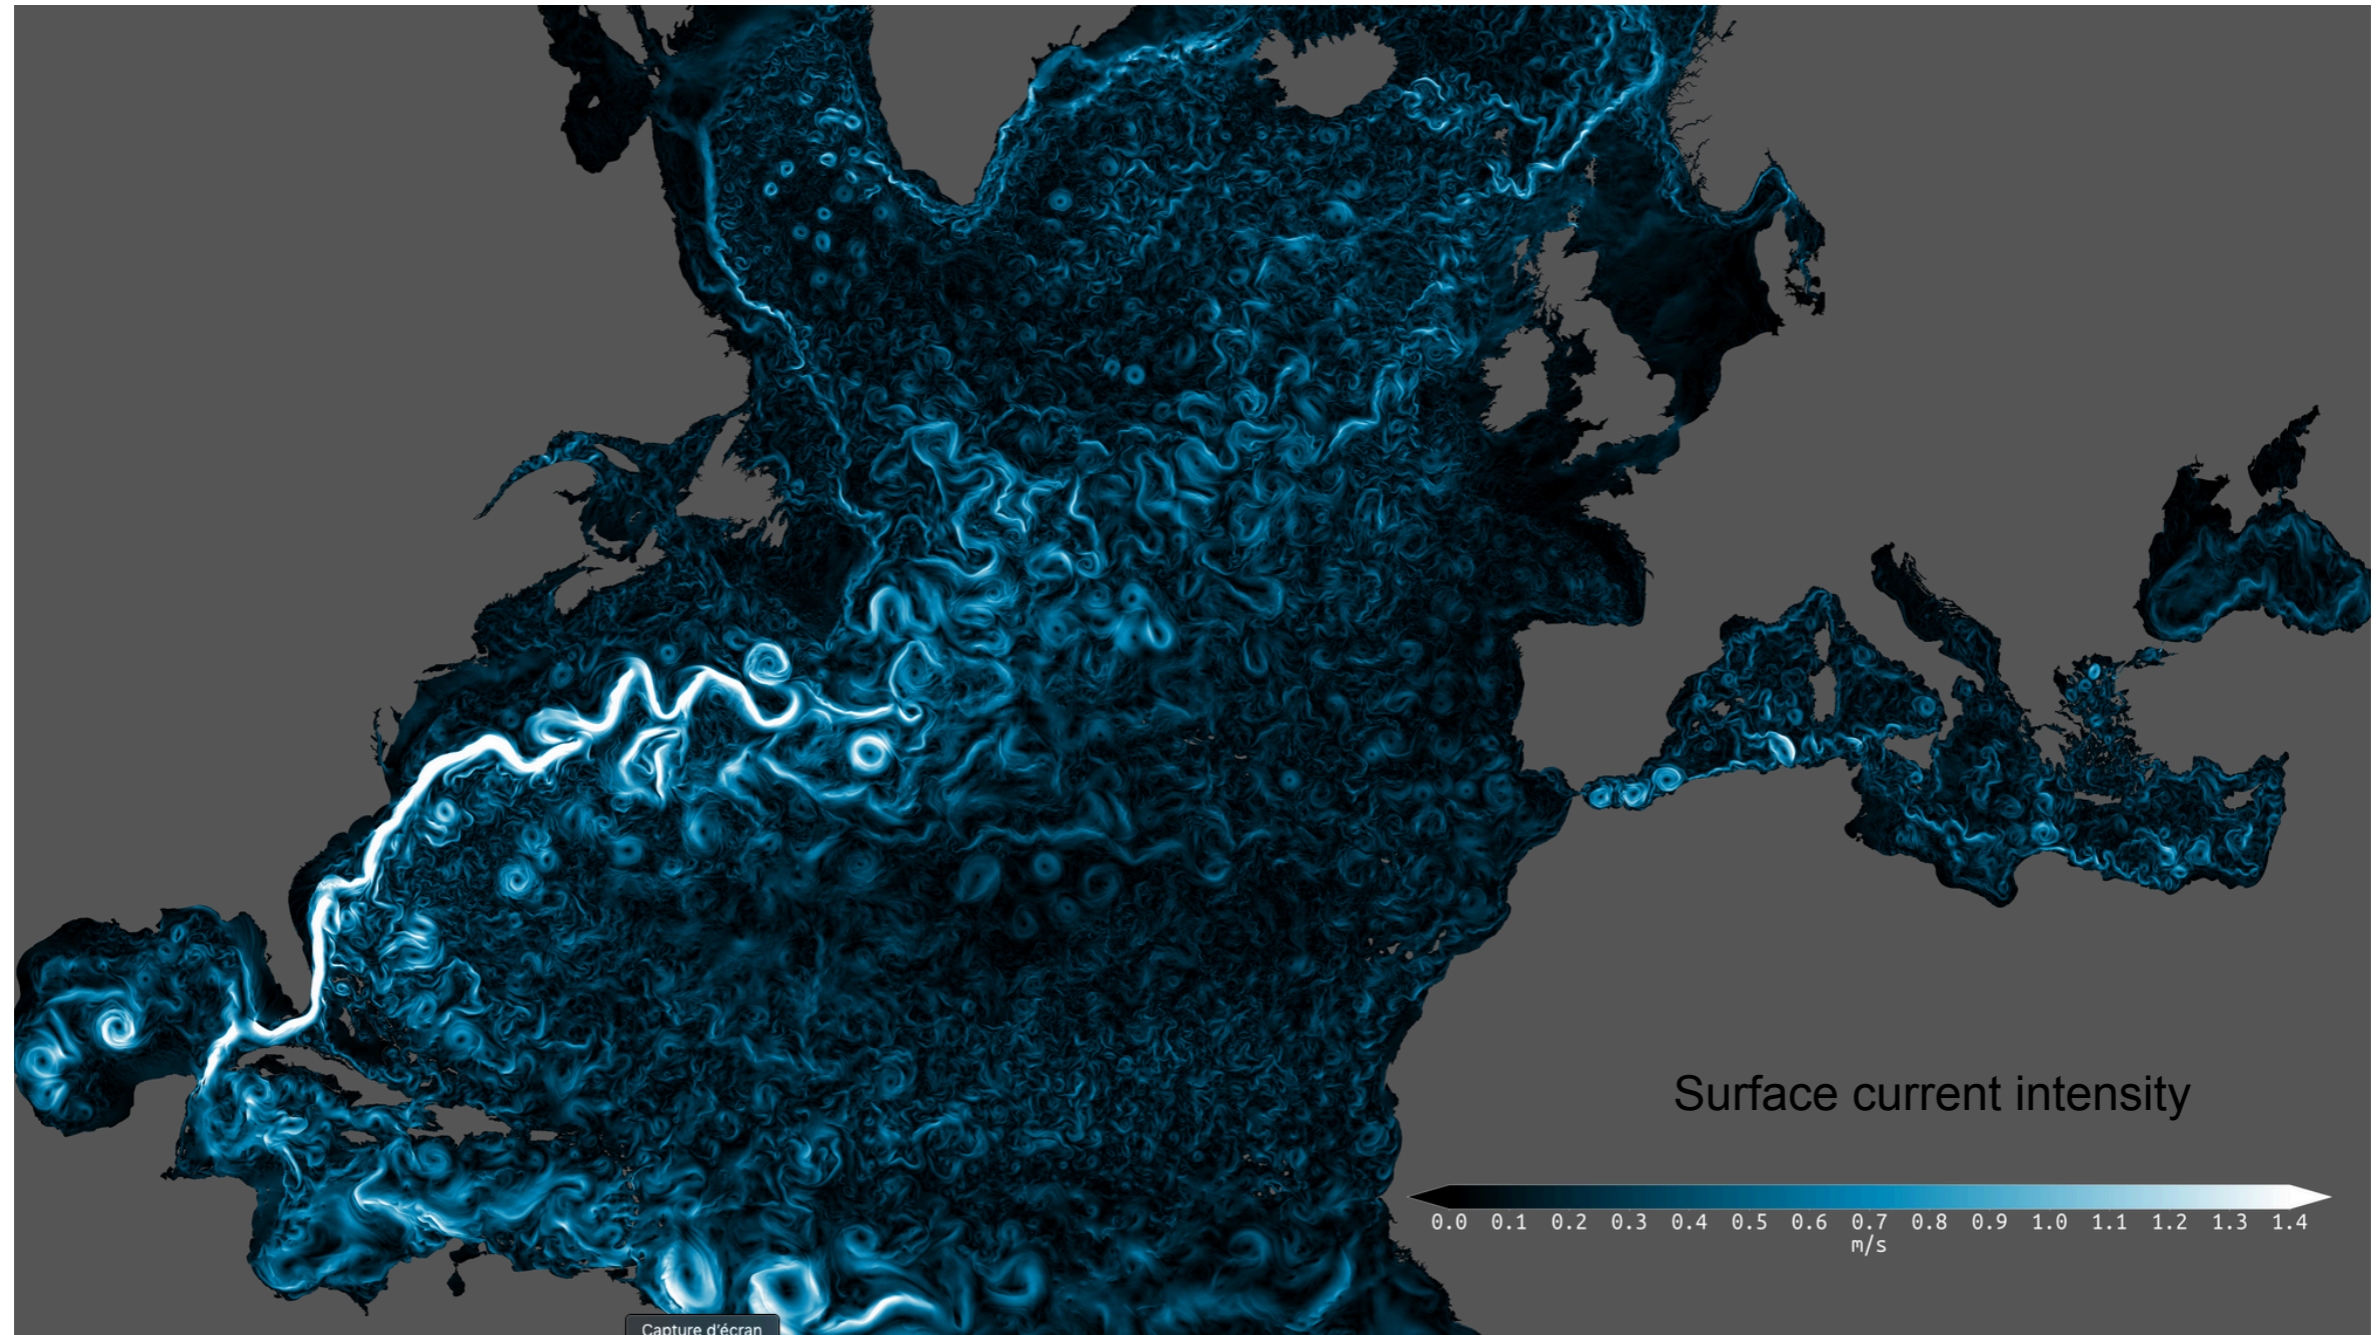

H: layer thickness

$\Omega$ : Earth rotation

- \* ~30 km in the ocean, ~1000 km in the atmosphere
- \* Ocean weather simulations require high resolution models!

(Chelton et al, 1998)

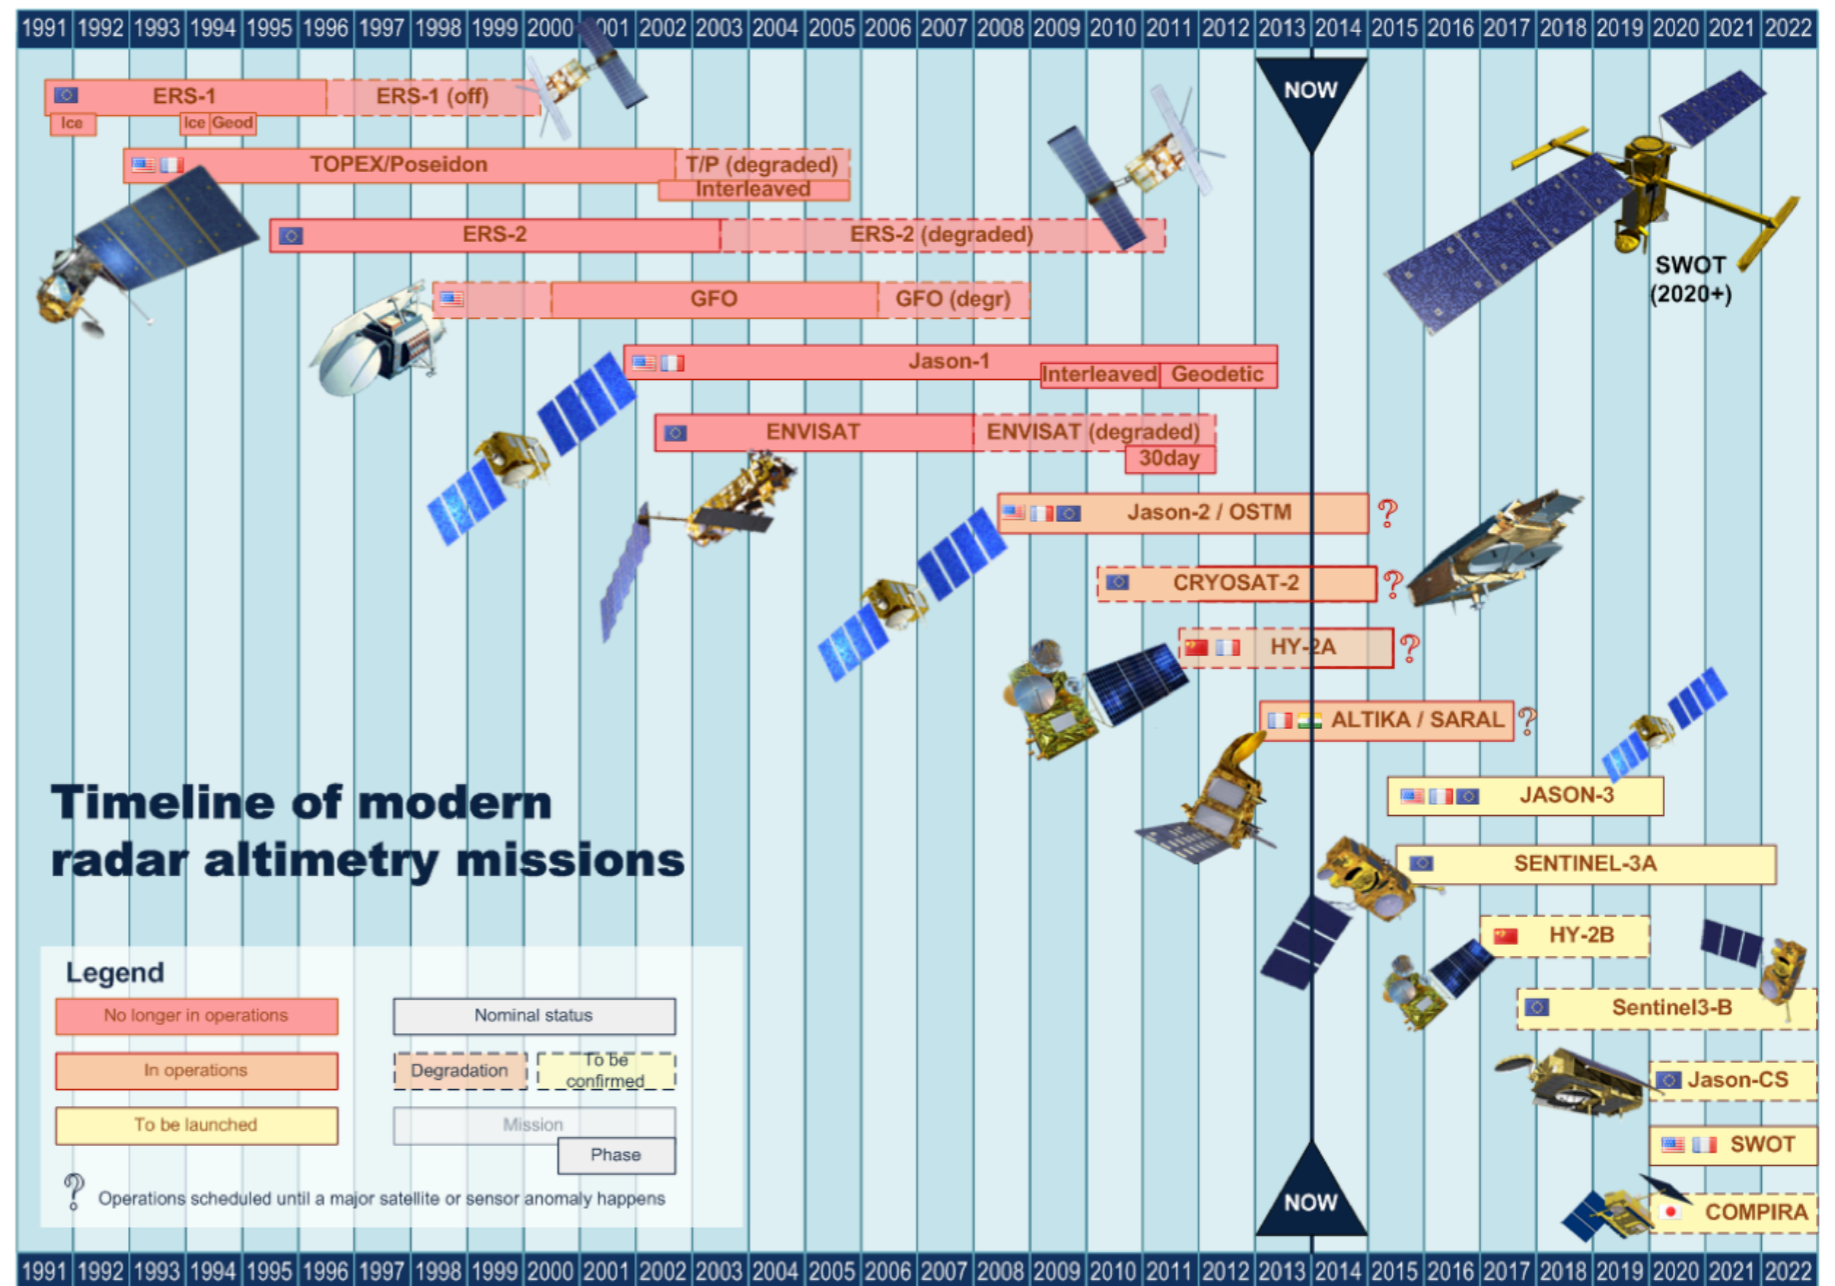

1. Atmospheric vs oceanic data assimilation

  - 3.2. Altimetric products and the SWOT mission
  - 3.3. Mapping balanced motions with a nudging technique
  - 3.4. Eddy/wave separation with a 4DVar technique

# Operational oceanography

## Use of data assimilation

Operational oceanography started about 25 years ago.

The main goal is real-time monitoring and prediction of the state of the ocean, including:

- Currents (shipping, sea operations, regattas...)
- Primary production (marine resources, fishing)
- Sea ice (shipping)
- Temperature (climate, weather forecasting...)

Like weather forecast centers, OO centers provide useful information to scientists: reanalyses, targeted forecasts for field campaigns, etc.

### Mercator Ocean International:

- The French center of OO;
- Created in 1995;
- Located in the area of Toulouse, about 50 agents;
- officially appointed by the European Commission on 11 November, 2014 to implement and operate the Copernicus Marine Service (CMEMS).
- Development in collab with research labs
- <http://www.mercator-ocean.fr/>

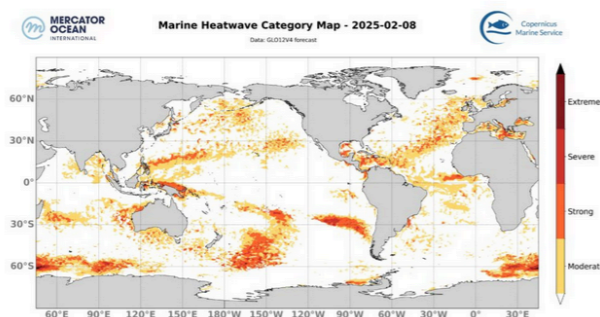

## Marine heatwave forecasts – 8 February

 Andreia Carvalho

 Marine Heatwave Bulletin

The marine heatwave bulletin provides forecasts and analysis of marine heatwave events across the globe and throughout the year. Used datasets include observations (satellite sea surface temperature maps) and numerical model analyses (assimilating satellite and in situ observations) to derive marine heatwave forecasts for a 10-day period. [\[1\]](#) **This week's forecasts were produced using as a comparison the marine heatwave situation on 28/01/2024.**

### Forecasts for 8 February

# Ocean models

## Primitive equations

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} = f v - \frac{1}{\rho} \frac{\partial p}{\partial x} + K_u \frac{\partial^2 u}{\partial z^2}$$

$$\frac{\partial v}{\partial t} + u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} = -f u - \frac{1}{\rho} \frac{\partial p}{\partial y} + K_v \frac{\partial^2 v}{\partial z^2}$$

$$-\frac{\partial p}{\partial z} = \rho g$$

### Nonlinear terms

$$\text{div } \vec{u} = 0$$

$$\rho \frac{DS}{Dt} = \text{div} (K_S \text{grad } S)$$

$$\rho C_v \frac{DT}{Dt} = \text{div} (K_T \text{grad } T)$$

$$\rho = \rho(T, S, p)$$

+ auxiliary conditions

Conservation of:

- momentum
- Mass
- Salt
- Temperature
- Equation of state

- Mercator operational model: NEMO 1/12°
- Number of gridpoints:  

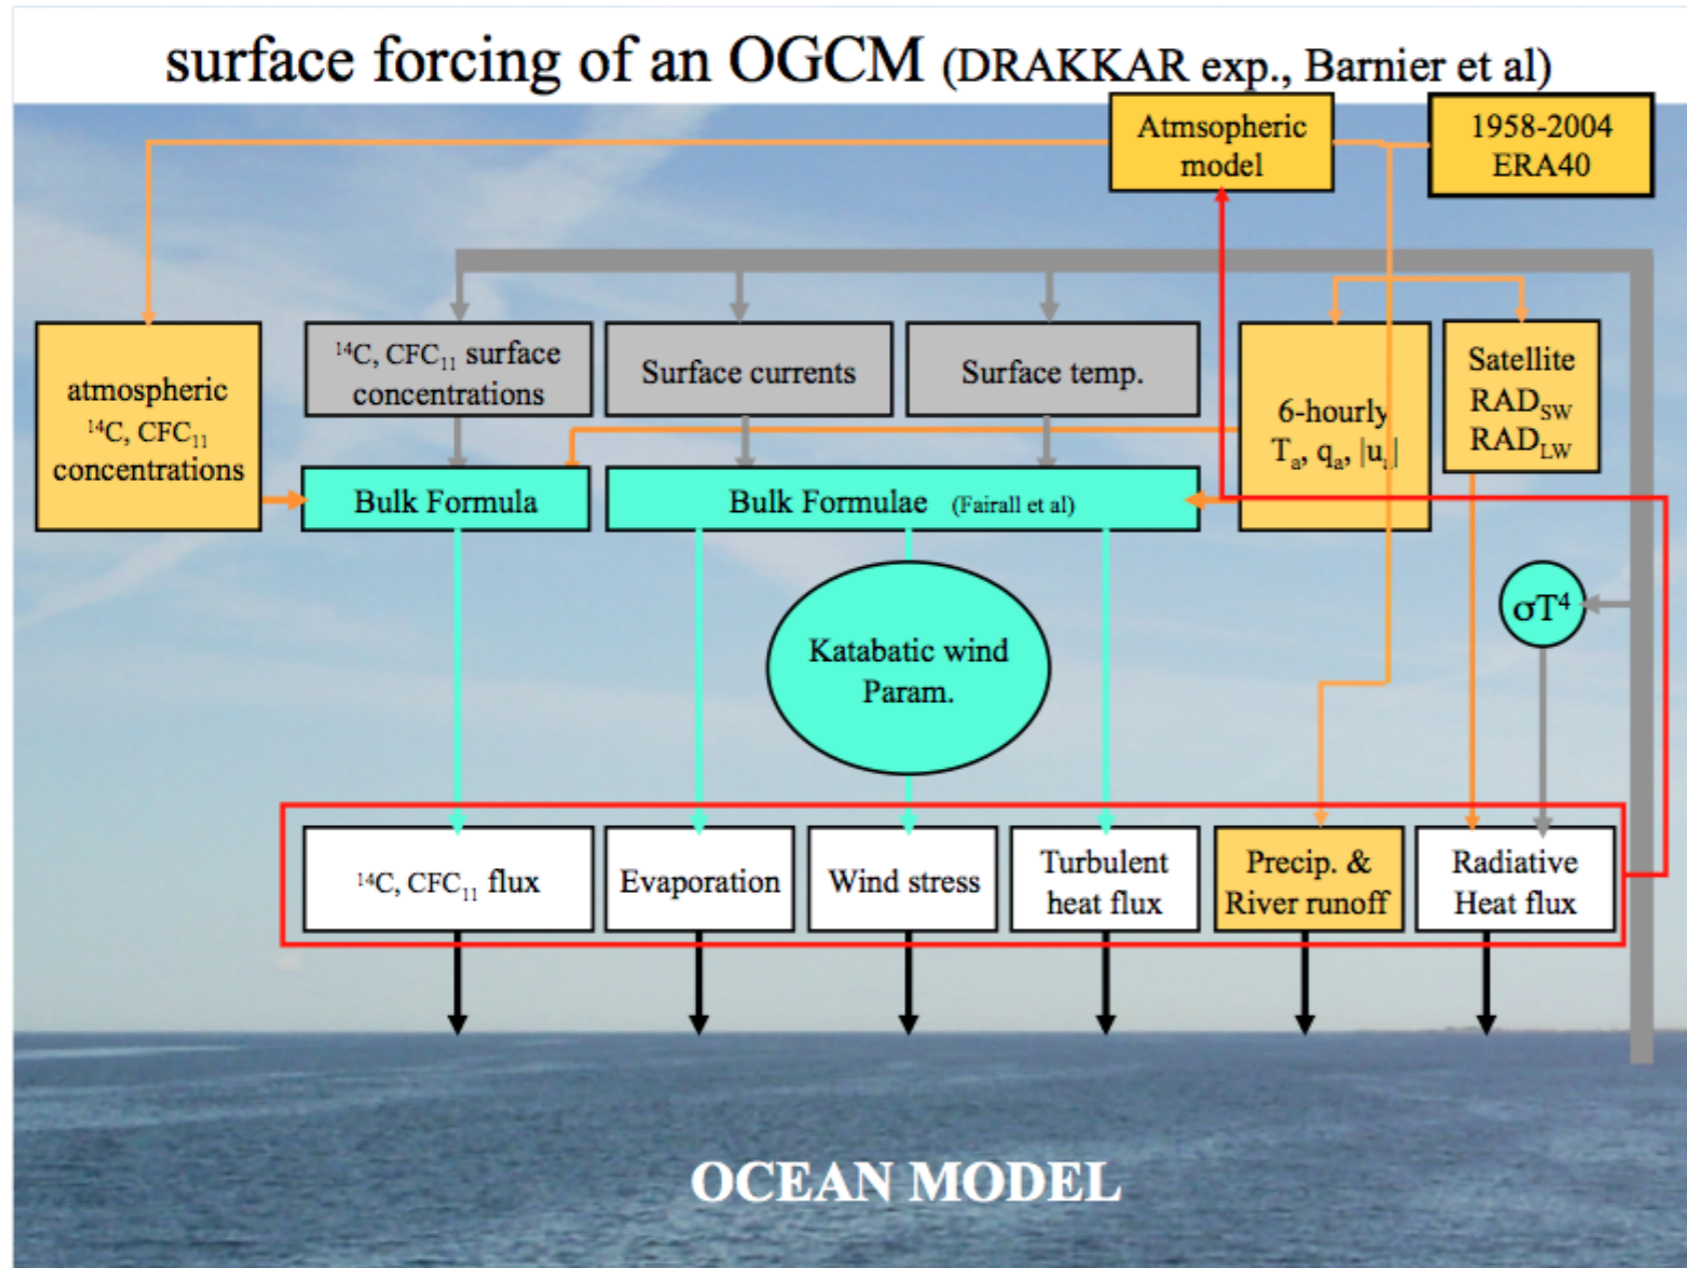

$$4322 \times 3059 \times 75 \sim 10^9$$
- 1 year of simulation costs 414 Gb memory, 90000 CPU hours, 1Tb storage (daily outputs)

# Observations of the ocean

## Satellite observation #1: altimetry

# Observations of the ocean

## Satellite observation #2: SST

- IR radiometer (e.g. AVHRR) →
- Microwave radiometer (e.g. AMSR-E) ↘
- Both at 1-km resolution.
- MW insensitive to clouds but less sensitive and easy to calibrate.

Some IR sensors are on-board geostationary satellites (res. 5 km). Most are polar orbiting.

Two issues with satellite SST from the DA viewpoint:

- Cloud detection
- SST is a “skin” temperature (representation error)

# EnKF implementations

## Kalman filter equations

**Initialization:**  $\mathbf{x}_0^f$  and  $\mathbf{P}_0^f$

**Analysis step:**

$$\mathbf{K}_k = (\mathbf{H}_k \mathbf{P}_k^f)^T [\mathbf{H}_k (\mathbf{H}_k \mathbf{P}_k^f)^T + \mathbf{R}_k]^{-1},$$

$$\mathbf{x}_k^a = \mathbf{x}_k^f + \mathbf{K}_k (\mathbf{y}_k^o - \mathbf{H}_k \mathbf{x}_k^f),$$

$$\mathbf{P}_k^a = (\mathbf{I} - \mathbf{K}_k \mathbf{H}_k) \mathbf{P}_k^f.$$

**Forecast step:**

$$\mathbf{x}_{k+1}^f = \mathbf{M}_{k,k+1} \mathbf{x}_k^a,$$

$$\mathbf{P}_{k+1}^f = \mathbf{M}_{k,k+1} \mathbf{P}_k^a \mathbf{M}_{k,k+1}^T + \mathbf{Q}_k.$$

# EnKF implementations

## Kalman filter equations

Initialization:  $\mathbf{x}_0^f$  and  $\mathbf{P}_0^f$

Analysis step:

$$\mathbf{K}_k = (\mathbf{H}_k \mathbf{P}_k^f)^T [\mathbf{H}_k (\mathbf{H}_k \mathbf{P}_k^f)^T + \mathbf{R}_k]^{-1},$$

$$\mathbf{x}_k^a = \mathbf{x}_k^f + \mathbf{K}_k (\mathbf{y}_k^o - \mathbf{H}_k \mathbf{x}_k^f),$$

$$\mathbf{P}_k^a = (\mathbf{I} - \mathbf{K}_k \mathbf{H}_k) \mathbf{P}_k^f.$$

Often too big to invert

Too big to store

Forecast step:

$$\mathbf{x}_{k+1}^f = \mathbf{M}_{k,k+1} \mathbf{x}_k^a,$$

$$\mathbf{P}_{k+1}^f = \mathbf{M}_{k,k+1} \mathbf{P}_k^a \mathbf{M}_{k,k+1}^T + \mathbf{Q}_k.$$

Rarely that simple, and unknown

Often nonlinear in practice

# EnKF implementations

## EnKF forecast step

- \* In the forecast step, each member is advanced with the numerical model:

$$\mathbf{x}_{k+1,i}^f = M_{k,k+1}(\mathbf{x}_{k,i}^a) + \eta_{k,i}$$

# EnKF implementations

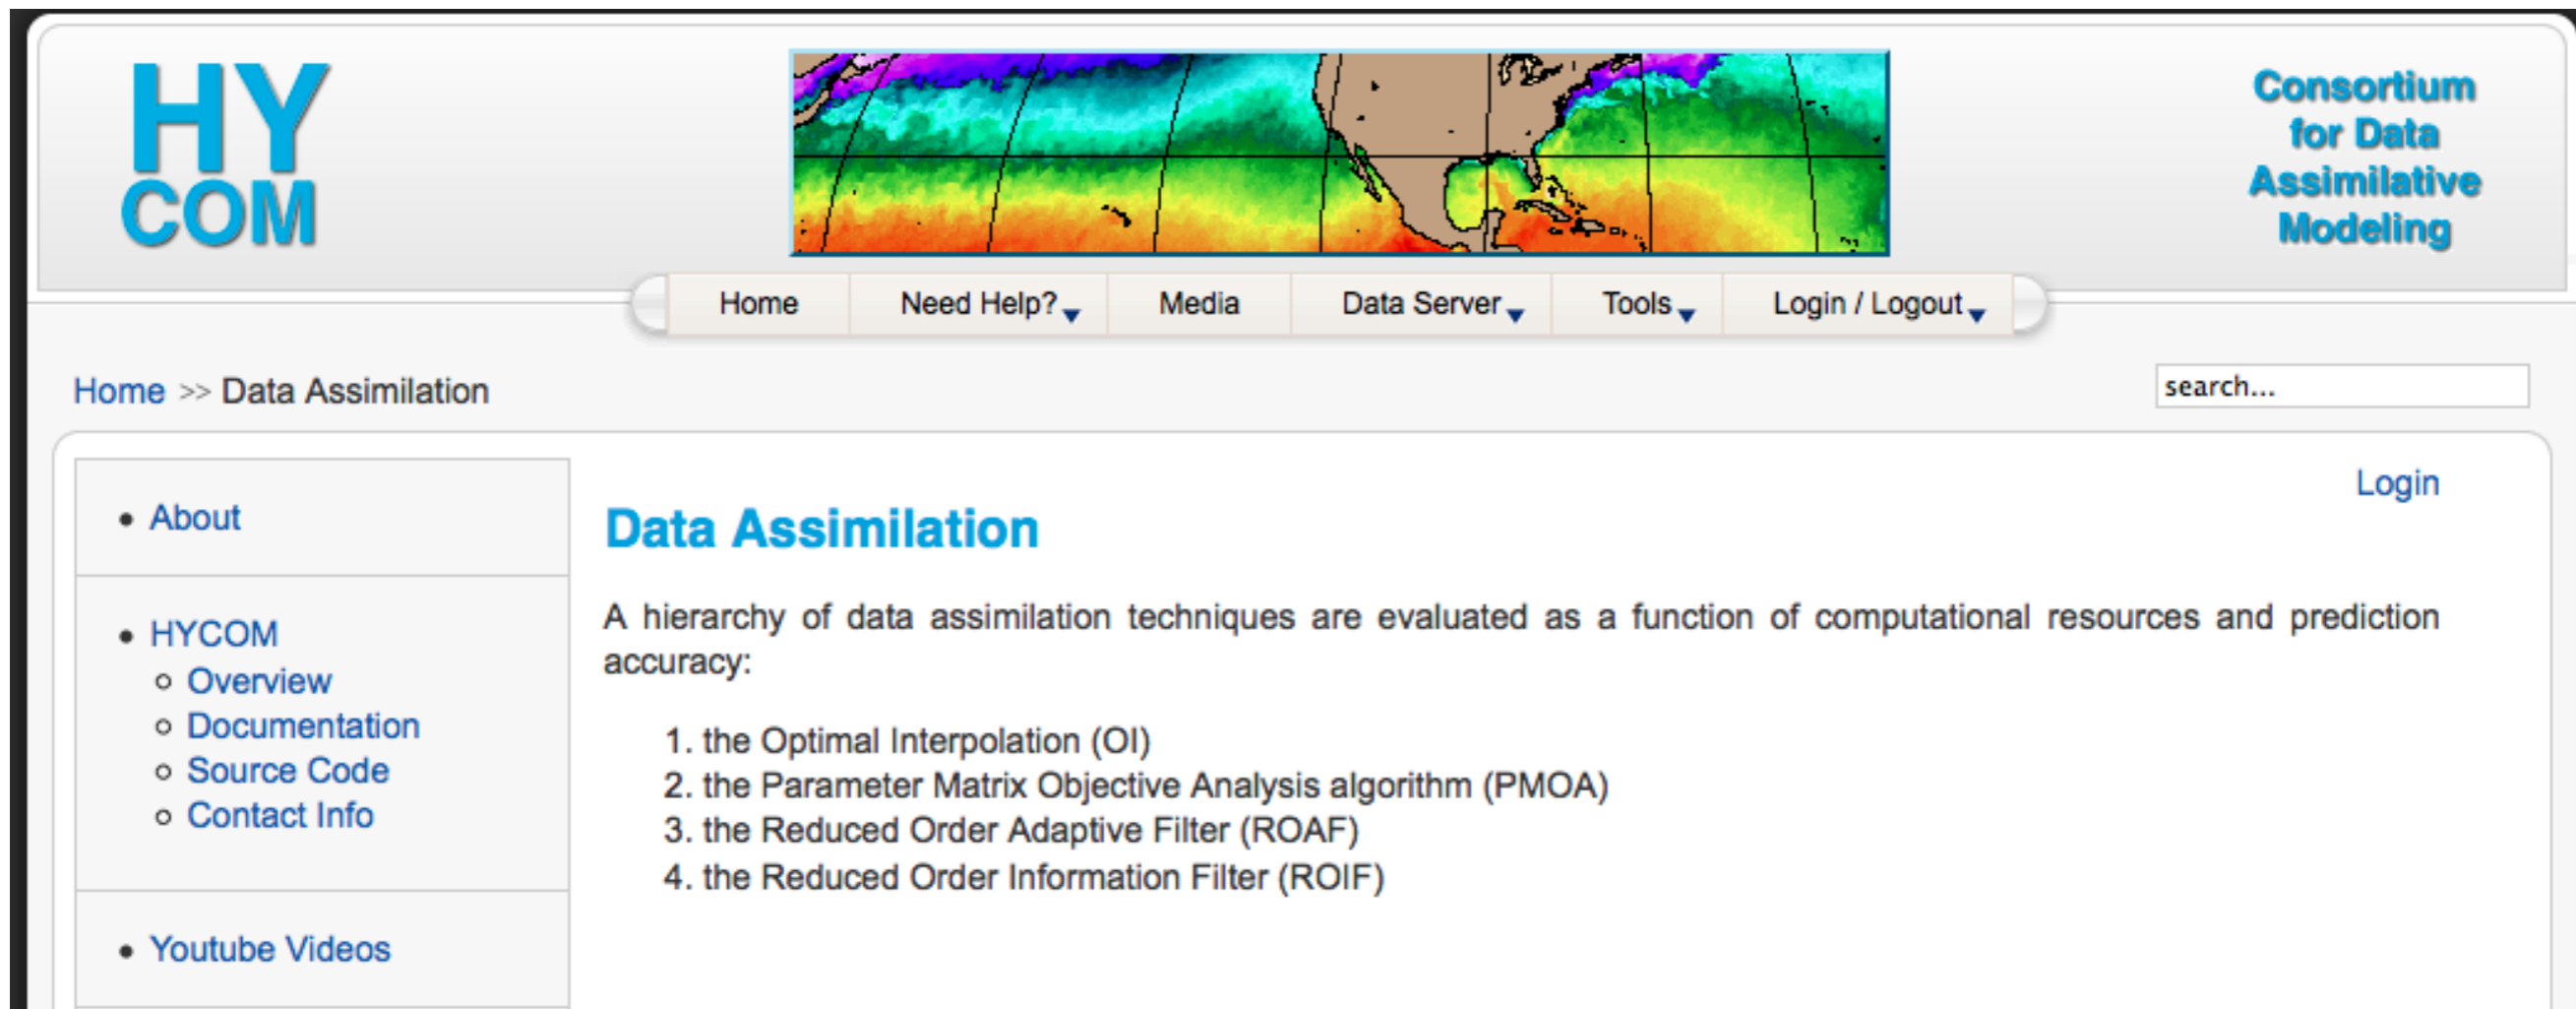

## EnKF analysis step

- At the analysis step, each member is corrected using observations.
- Different analysis schemes exist:
  - stochastic/deterministic,
  - algebra in observation/ensemble space,
  - Serial/batch processing of observations,
  - With/without adaptive scheme at some point,
  - etc

The screenshot shows the HYCOM website interface. At the top left is the HYCOM logo. To its right is a colorful map of the ocean. Further right is the text "Consortium for Data Assimilative Modeling". Below the logo and map is a navigation menu with items: Home, Need Help?, Media, Data Server, Tools, and Login / Logout. Below the navigation menu is a breadcrumb trail "Home >> Data Assimilation" and a search box. On the left side, there is a sidebar menu with "About", "HYCOM" (with sub-items: Overview, Documentation, Source Code, Contact Info), and "Youtube Videos". The main content area is titled "Data Assimilation" and contains the text: "A hierarchy of data assimilation techniques are evaluated as a function of computational resources and prediction accuracy:" followed by a numbered list: 1. the Optimal Interpolation (OI), 2. the Parameter Matrix Objective Analysis algorithm (PMOA), 3. the Reduced Order Adaptive Filter (ROAF), and 4. the Reduced Order Information Filter (ROIF). A "Login" link is visible in the top right corner of the main content area.

- Ol methods
  - Forecast of 1 (mean) state
  - Analysis using statistics from a fixed ensemble
- Stochastic EnKF
  - Correction of each state with perturbed observations
- Deterministic EnKFs
  - Correction of mean and anomalies without perturbing observations

# EnKF implementations

## Flavors of EnKF: A simple view

- Ocean DA:  $O(10^6 - 10^8)$  variables,  $O(10^3 - 10^5)$  obs.
- Ensemble Kalman filters used in operational oceanic DA systems:
  - Ensemble OI (Mercator-Océan, France; Bureau of Meteorology, Australia; and others)
  - Deterministic EnKF (NERSC, Norway)

# EnKF implementations

## Ensemble Optimal Interpolation

- Ensemble OI:
  - Only a mean state is propagated with the model;
  - The error modes (ensemble anomalies) are the same at all analysis steps.
- - - - : no estimation of uncertainties;
- +++: computationally affordable, robust (no collapse), more “physically-based” than historical OI with analytical covariance functions.

- Localization aims at delimiting in space the impact of an observation;
- Localization is necessary for several reasons:
  - To avoid long-range corrections due to spurious long-range correlations, themselves due to the small size of the ensemble;
  - To artificially increase the rank of the covariance matrix and provide more degrees of freedom to the corrections;
  - To make computation possible in some cases.

# EnKF implementations

## Localization

- Localization aims at delimiting in space the impact of an observation;
- Localization is necessary for several reasons:
  - To avoid long-range corrections due to spurious long-range correlations, themselves due to the small size of the ensemble;
  - To artificially increase the rank of the covariance matrix and provide more degrees of freedom to the corrections;
  - To make computation possible in some cases.

Short illustration of this, today

# EnKF implementations

## Localization

Increments in SSH due to an observation here

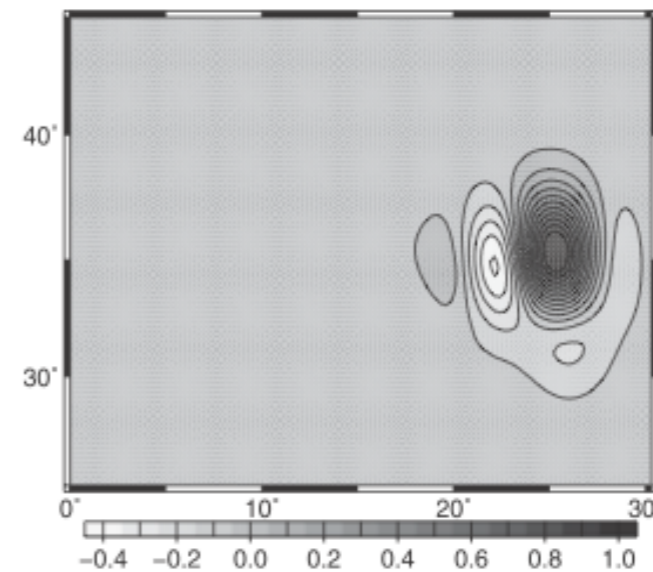

m=5000; no rank reduction

m=200; no rank reduction

m=5000; rank reduction r=20

Without  
localization

With  
localization

m=200; no rank reduction  
Awkward localization

m=200; no rank reduction

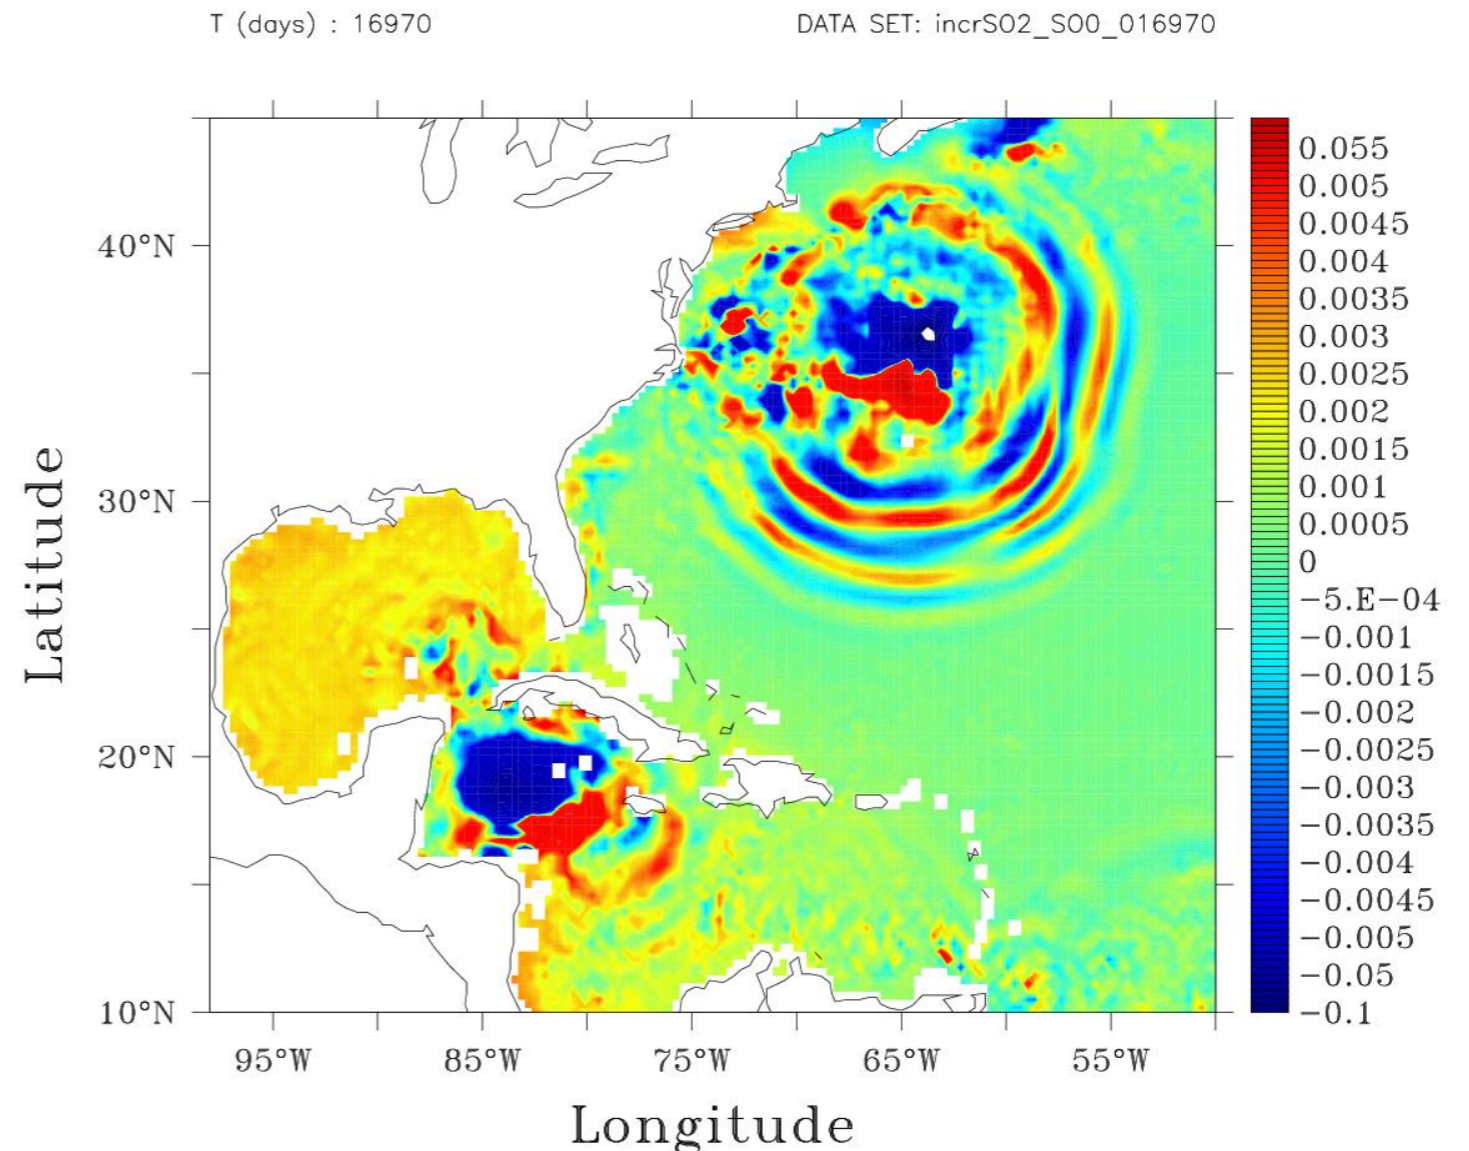

m=5000; rank reduction r=20

# EnKF implementations

## Incremental Analysis Updating (IAU)

Model not involved during analysis: discontinuity, balance problems and shocks at restart possible.

Right: spurious wave generated by the assimilation of a single observation.

# EnKF implementations

## Incremental Analysis Updating (IAU)

- An empirical solution is Incremental Analysis Updating (IAU, Bloom et al, 1996)
- IAU consists in computing corrections at the analysis step, then re-running the ensemble over the forecast window, adding incrementally to each member its correction under the form of a forcing term.

Here, IAU is run from the middle of the previous forecast window to the middle of the next forecast window.

Continuity is guaranteed (perhaps at the expense of quality of the analysis).

FIG. 1. IAU method from Bloom et al. (1996);  $\delta$  represents the increment.

# EnKF implementations

## Incremental Analysis Updating (IAU)

Figure: spatially averaged zonal velocity  $U$  in the Gulf Stream zone.

Black: free run

Red: EnOI

Green: EnOI with IAU

FIG. 12. Same as in Fig. 11, but at a 55-m depth (model depth level 5) from Julian day 15678 (4 Dec 1992) to 16038 (5 Dec 1993): black line represents FREE run, red line represents INT run, and green line represents IAU run.

- Some quantities must be conserved. Example: mass.

$$\operatorname{div} \mathbf{u} = 0$$

- Bogus: a fictitious observation of  $\operatorname{div} \mathbf{u}$ , equal to 0.
- Bogus can be used in regions where the assimilation makes things worse...

# EnKF implementations

## Gaussian anamorphosis

- Sometimes the distribution of some variables does not follow a Gaussian law;

**Distribution of silicate at 3 different dates (over a large oceanic domain)**

# EnKF implementations

## Gaussian anamorphosis

- Sometimes the distribution of some variables does not follow a Gaussian law;
- But the EnKFs work better with Gaussian variables;
- Gaussian anamorphosis: transformation of a distribution into a Gaussian distribution.

# EnKF implementations

## Gaussian anamorphosis

- The transformation can be analytical or empirical;
- On the opposite figure, the transformation is empirical;
- Such transformation can be performed on each variable individually.

# EnKF implementations

## Gaussian anamorphosis

- After transformation, the EnKF analysis is performed;
- Then, the physical variables are retrieved by the inverse transformation.

# EnKF implementations

## Gaussian anamorphosis

Obs. update at BATS station (65°W-32°N) using a perfect PHY observation. Prior ensemble (red), mean (green square), linear regression line (thin green line), truth (big blue dot), posterior ensemble (blue dots). Left: EnKF analysis; Middle: analysis in the transformed state space; Right: Anamorphosis-EnKF posterior. The thick green line on the right is the transformation of the thin green line on the middle.

# EnKF implementations

## About the observation error covariance matrix

$$\mathbf{P}^f = \mathbf{S}^f \mathbf{S}^{fT}$$

- The EnKF correction is either calculated with (using a serial processing of observations)

$$\delta \mathbf{x} = \mathbf{S}^f (\mathbf{H} \mathbf{S}^f)^T \left[ (\mathbf{H} \mathbf{S}^f) (\mathbf{H} \mathbf{S}^f)^T + \mathbf{R} \right]^{-1} (\mathbf{y} - \mathbf{H} \mathbf{x}^f),$$

- Or, with  $\Gamma = (\mathbf{H} \mathbf{S}^f)^T \mathbf{R}^{-1} (\mathbf{H} \mathbf{S}^f)$

$$\delta \mathbf{x} = \mathbf{S}^f [\mathbf{I} + \Gamma]^{-1} (\mathbf{H} \mathbf{S}^f)^T \mathbf{R}^{-1} (\mathbf{y} - \mathbf{H} \mathbf{x}^f).$$

# EnKF implementations

## About the observation error covariance matrix

- For simplification, all ocean DA systems consider the observation error covariance matrix diagonal.
- To minimize the impact of the neglected correlations, it is common to inflate the variances (in the Norwegian operational system, they are multiplied by 2 for the update of the anomalies).
- On the other hand, many efforts are dedicated to the construction of the state error covariance matrix.

## Sea Level anomaly maps

Present-day nadir altimetry is processed to provide gridded maps of Sea Level Anomaly. This is done with the DUACS algorithm at CNES/CLS, implementing statistical interpolation.

These maps resolve scales of 200 km and 10 days.

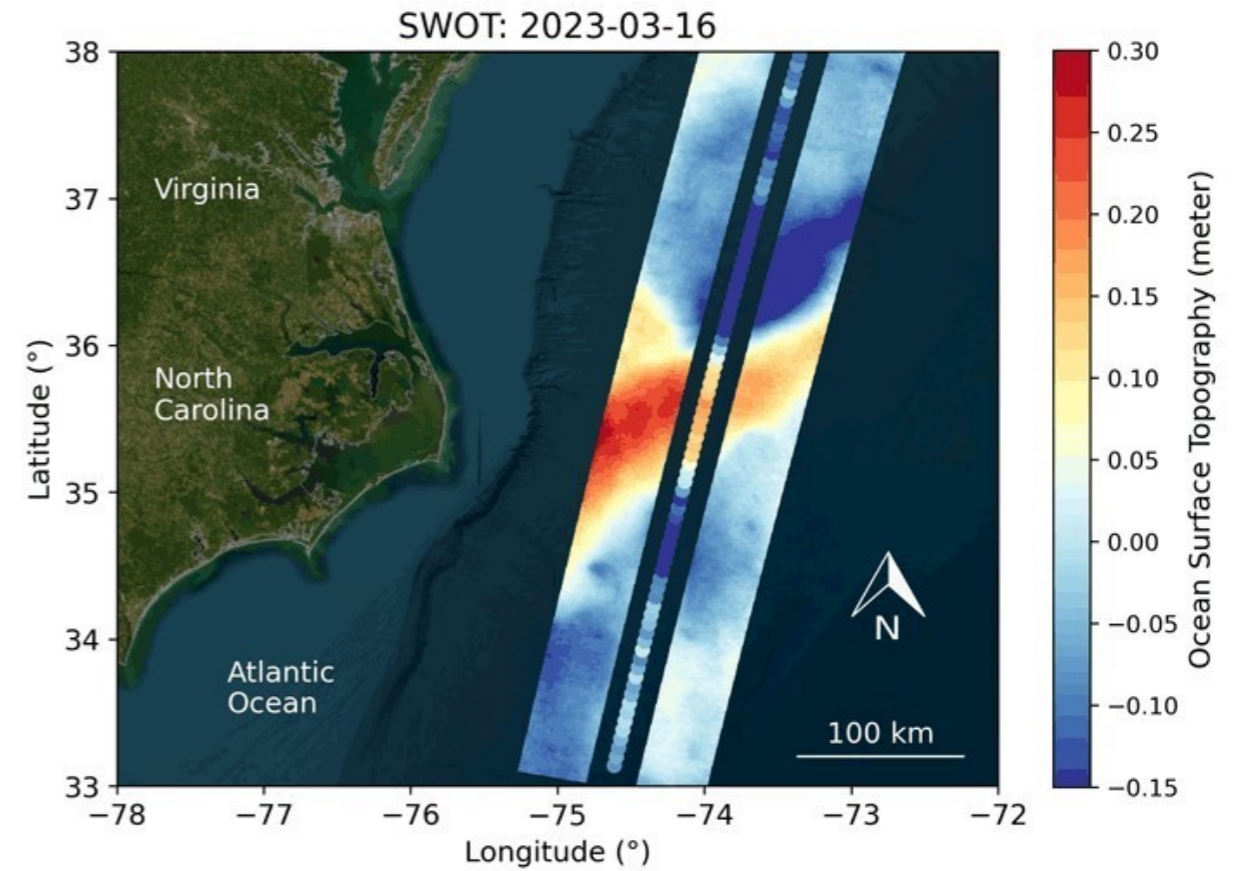

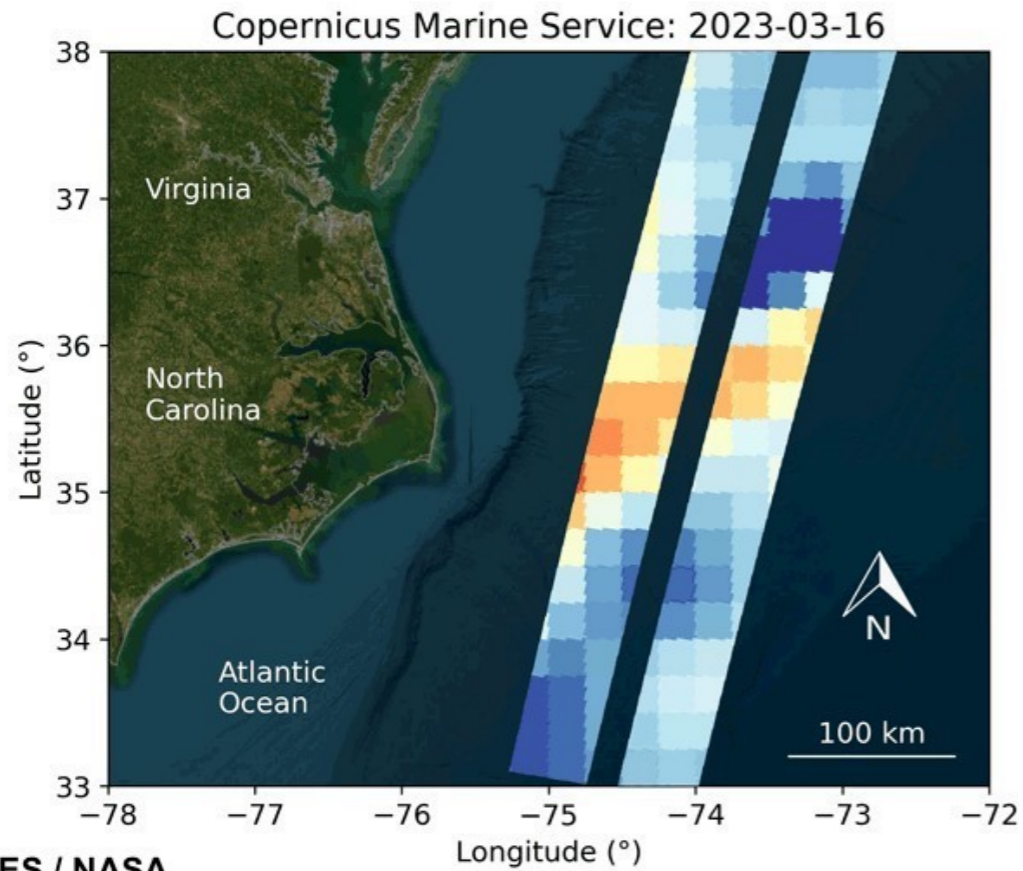

## The SWOT mission

- SWOT: Surface Water and Ocean Topography
- Satellite mission launched in 2022
- Revolutionary altimetric observation: 120 km-wide swath
- Pixel of 2 km, revisit 10 days (mismatch)

## The SWOT mission

### Le Gulf Stream vu par Copernicus et le satellite SWOT

## The SWOT mission

- Mismatch between spatial and temporal coverage of SWOT
- Expectation that dynamics must be considered in the interpolation
- ==> data assimilation

decorrelation time as a function of wavelength

1. Atmospheric vs oceanic data assimilation
  - 1.1. History and culture
  - 1.2. Observations
  - 1.3. Dynamics and models
2. "Model-centered" data assimilation
  - 2.1. Operational oceanography
  - 2.2. Ocean models
  - 2.3. Observations of the ocean
  - 2.4. Ensemble Kalman filter implementations
- 3. "Observation-centered" data assimilation**
  - 3.1. Assimilation of images
  - 3.2. Altimetric products and the SWOT mission
  - 3.3. Mapping balanced motions with a nudging technique
  - 3.4. Eddy/wave separation with a 4DVar technique

- Method: Back-and-forth nudging (BFN) with a 1.5-layer quasi-geostrophic (QG) model.
  - Why a simple 1.5-layer QG model?

*It is a simple model able to capture a large part of mesoscale ocean dynamics as observed by altimetry.*

- Why BFN?

*It is a conceptually simple method.*

*The QG dynamics is governed by a single variable, almost directly observed.*

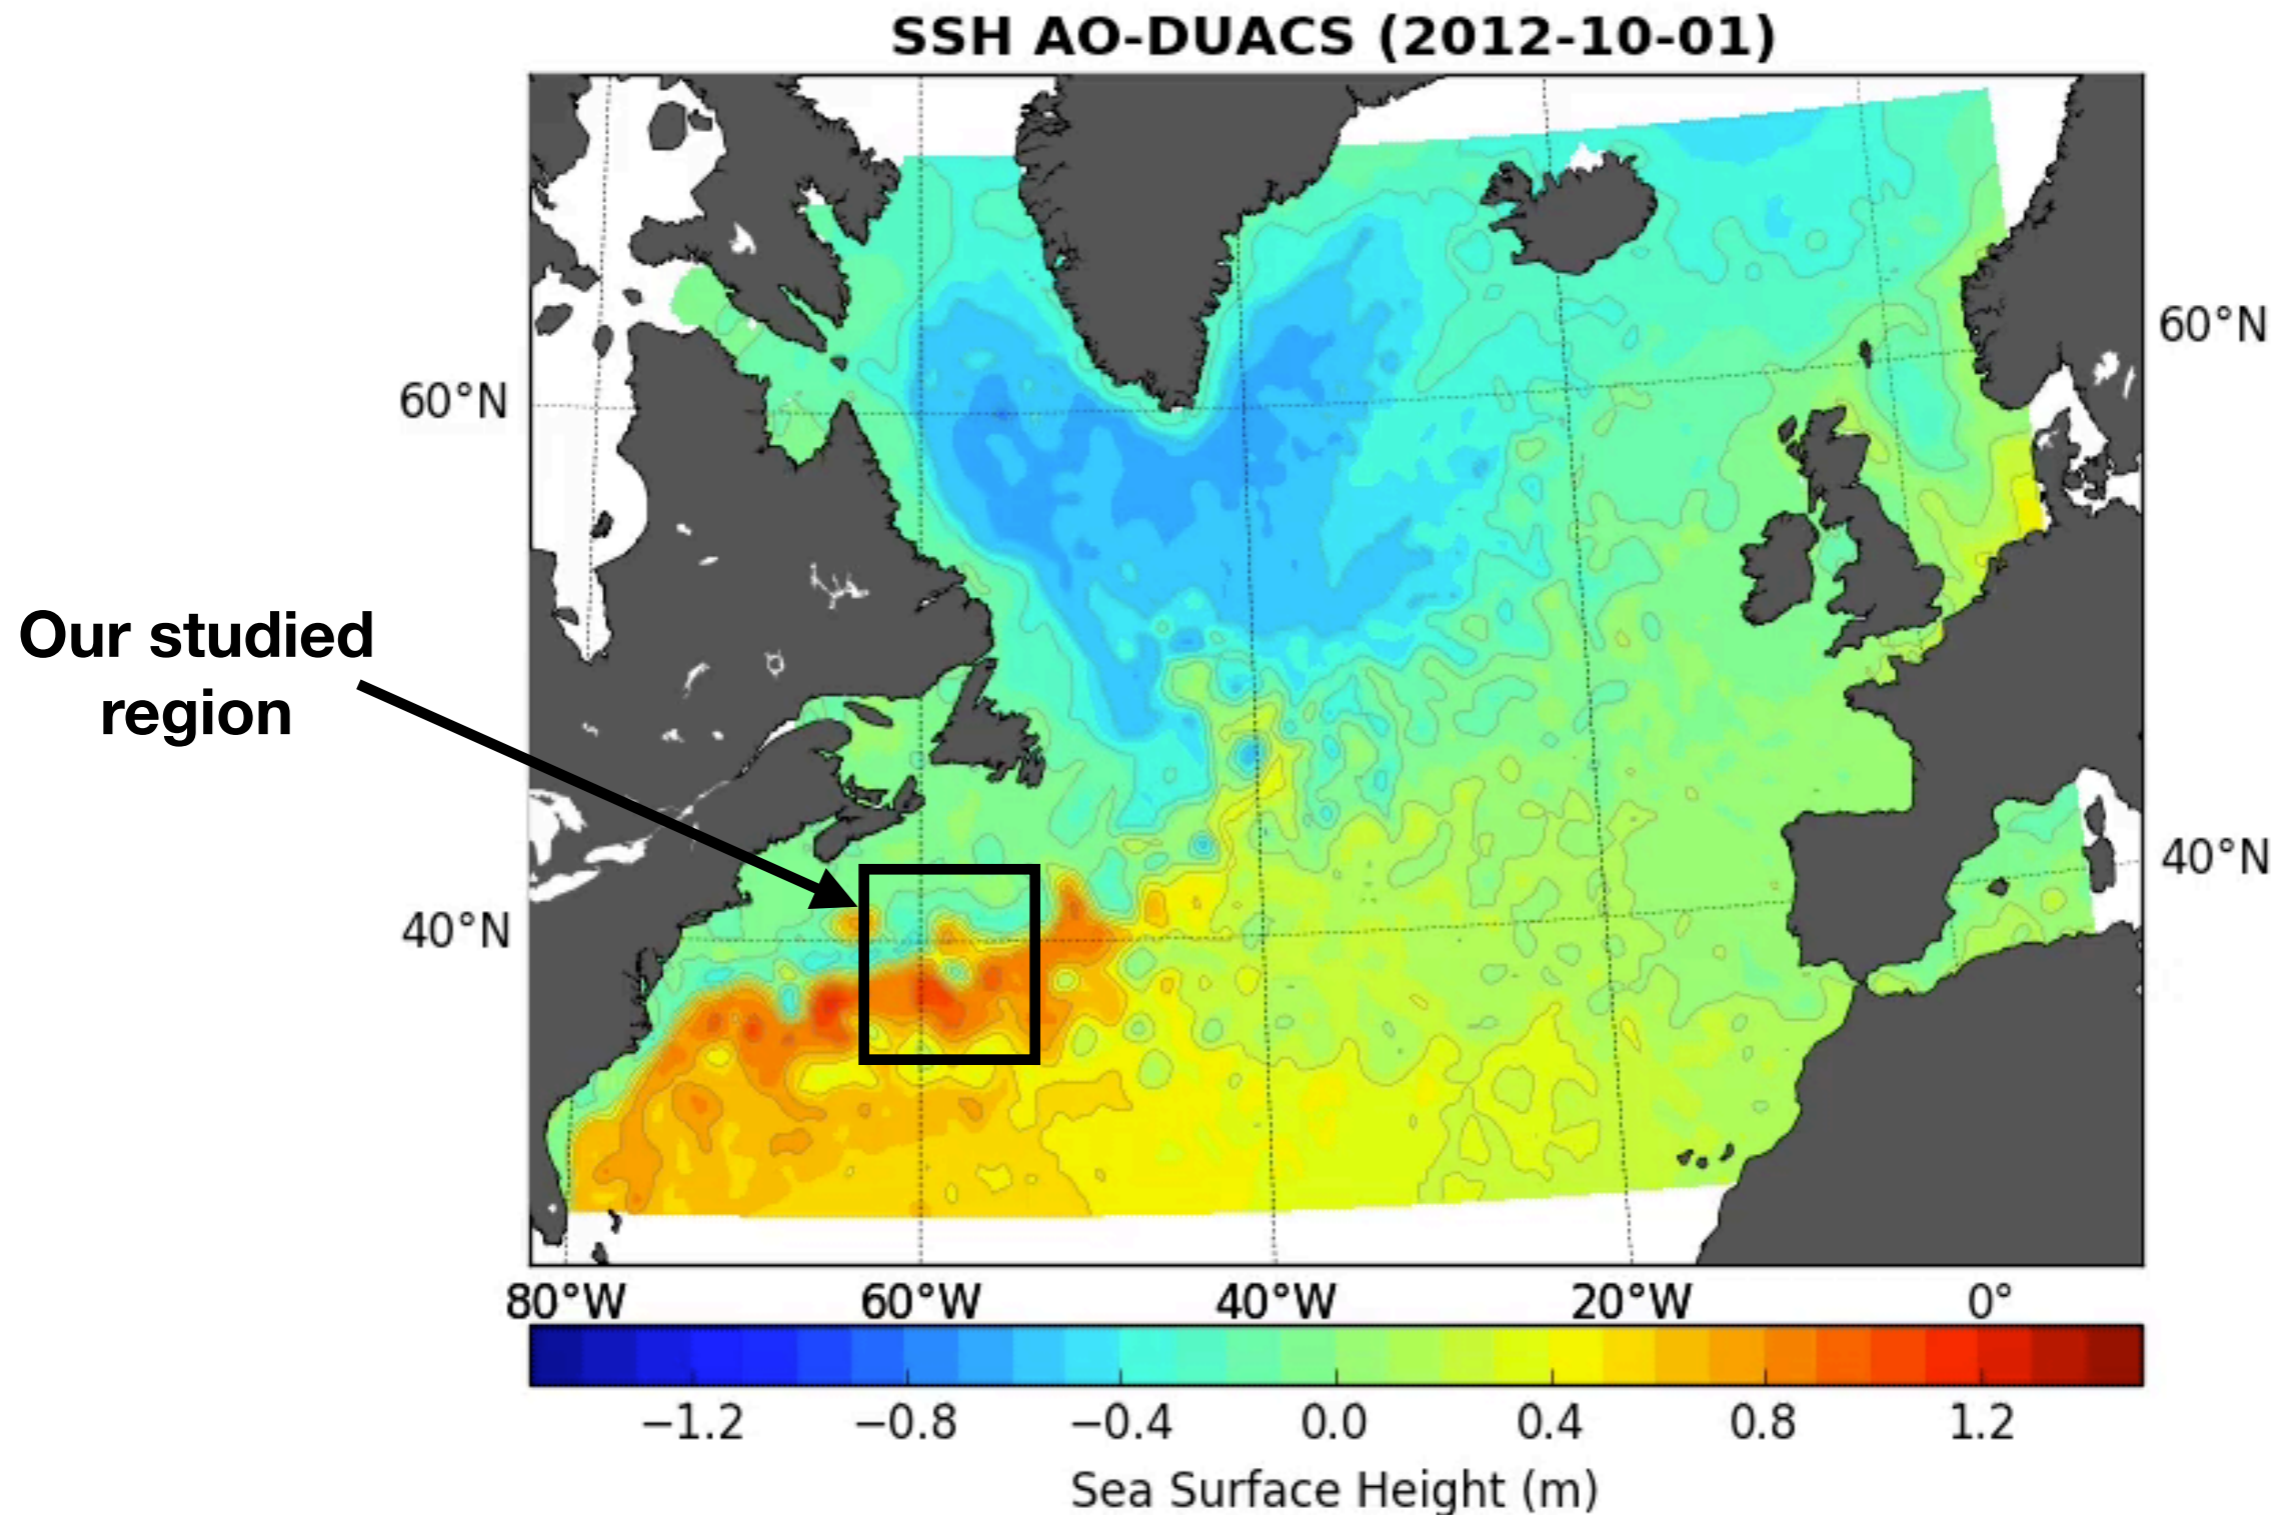

**(QG) Forward propagation:**  $\frac{\partial X}{\partial t} = M(X, t) \quad X(0) = x_0$

**Forward nudging:**  $\frac{\partial X}{\partial t} = M(X, t) + K(y^{obs} - X)$

**(QG) Backward propagation:**  $\frac{\partial X}{\partial t} = M(X, t) \quad X(T) = x_T$

**Backward nudging:**  $\frac{\partial X}{\partial t} = M(X, t) - K(y^{obs} - X)$

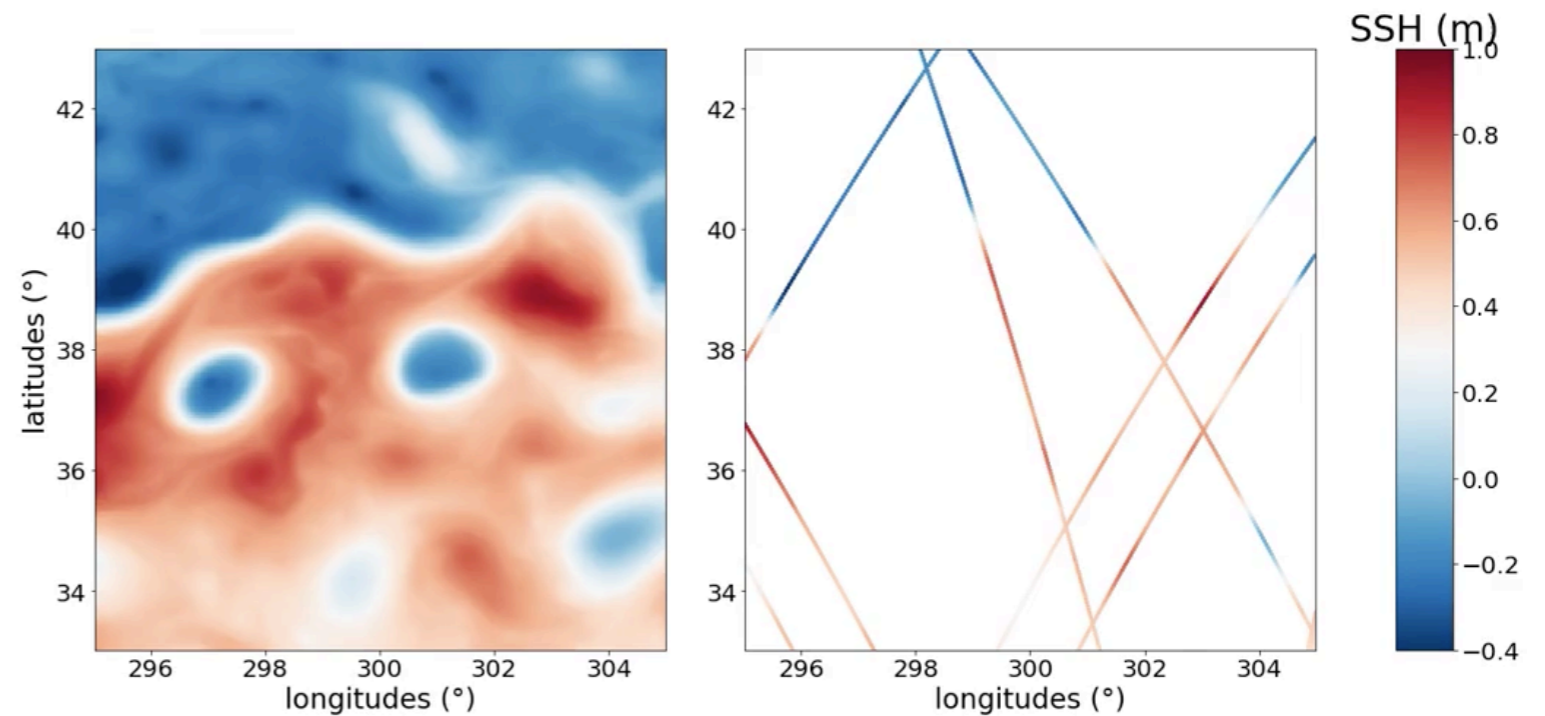

**BFN algorithm** (Auroux et al., 2008): combination of the **forward nudging** and the **backward nudging** in an **iterative** process over a temporal window

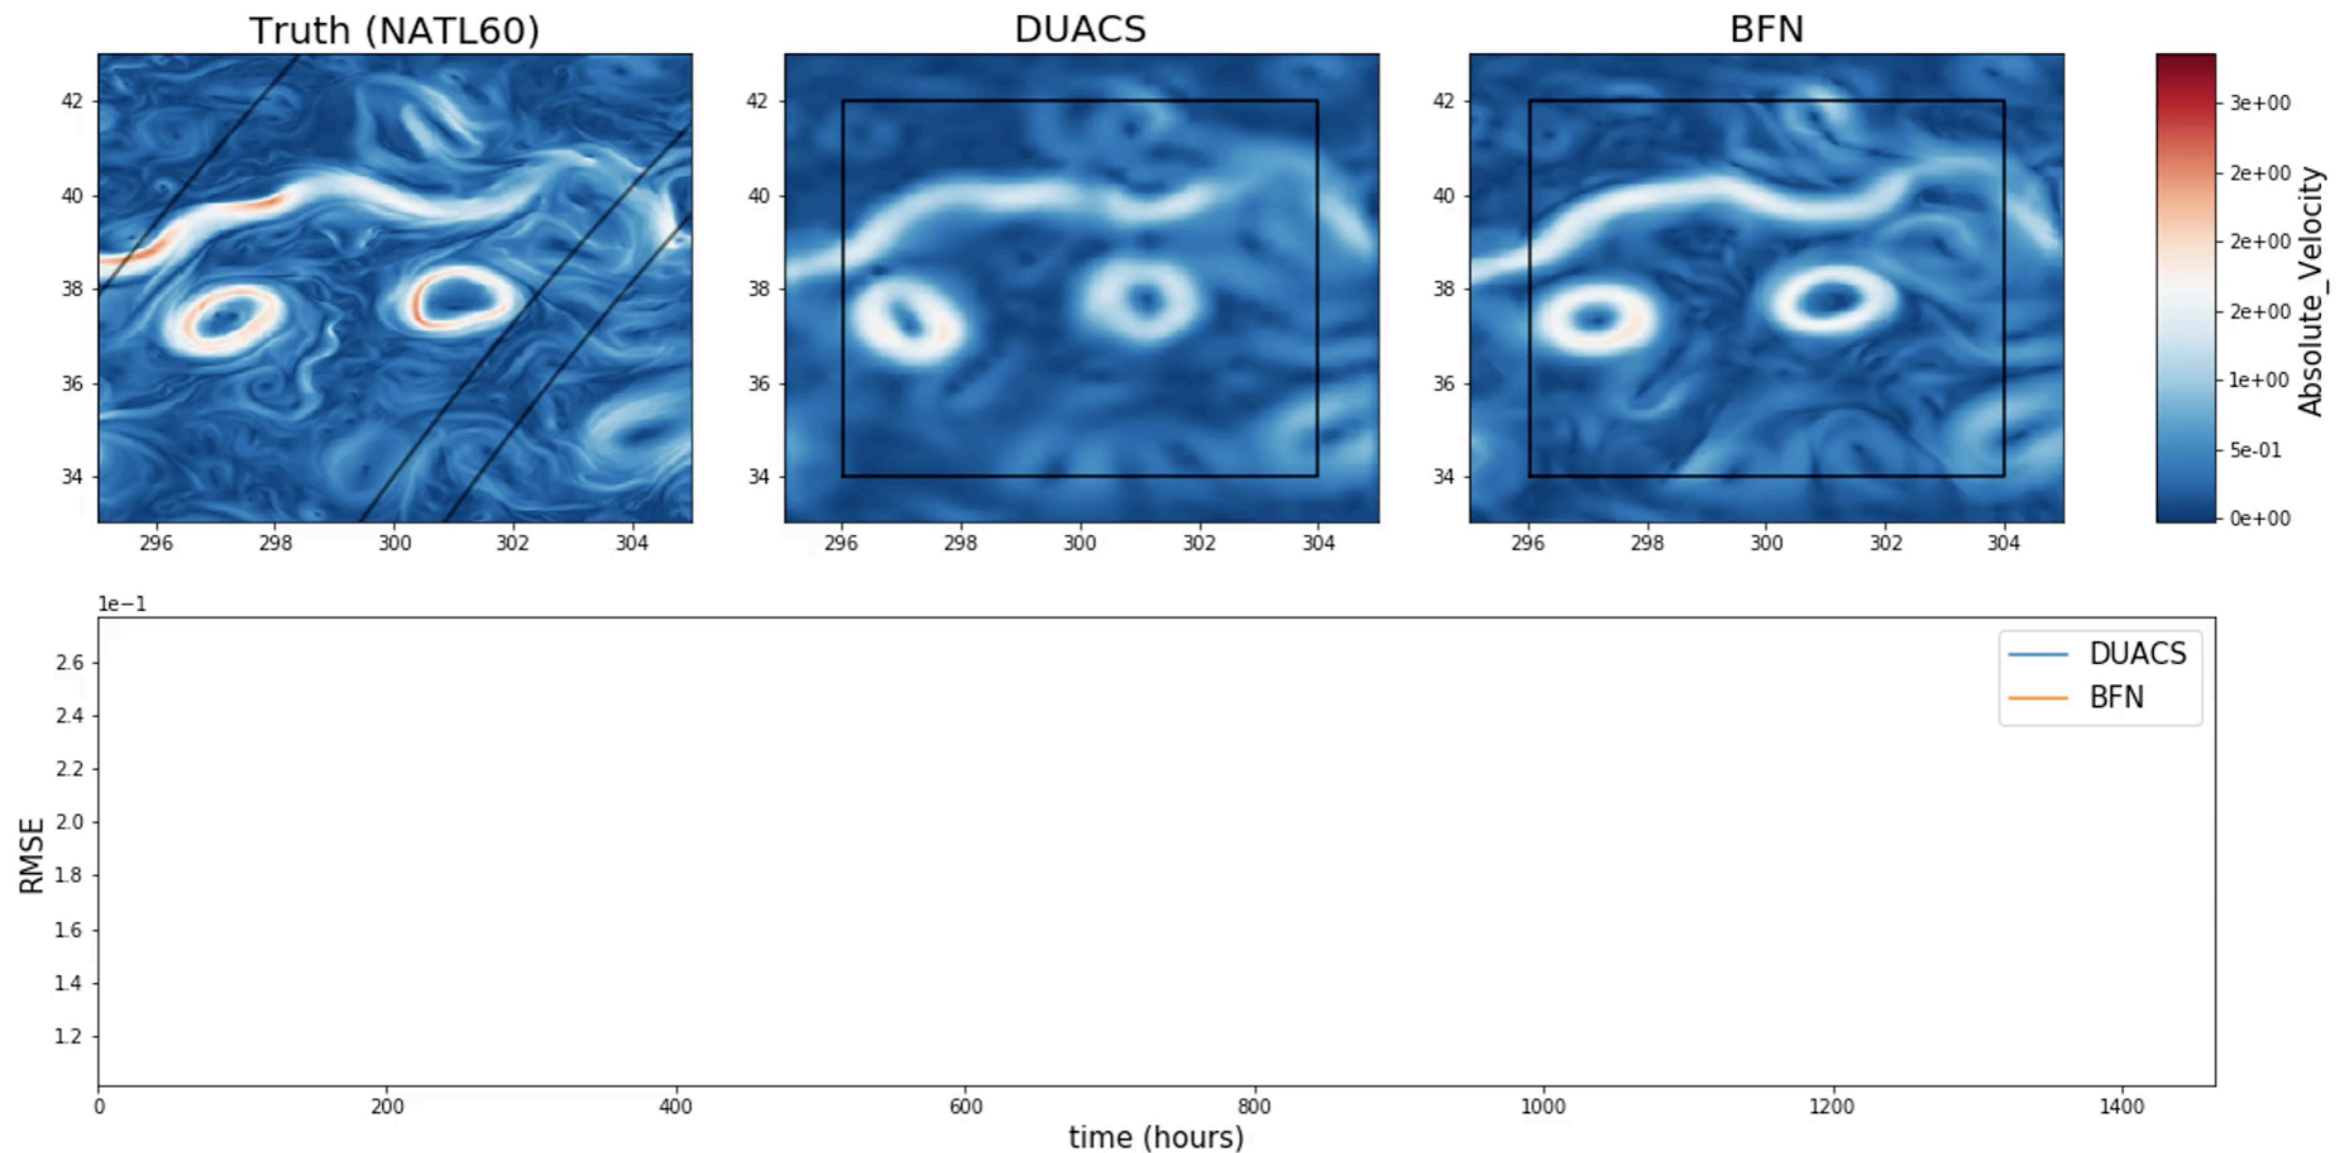

- 4 conventional along-track altimeters (Nadirs)
- SWOT
- No errors considered

## Problem statement

Phenomenon	Length scale $L$	Velocity scale $U$	Time scale $T$
<i>Atmosphere:</i>			
Sea breeze	5–50 km	1–10 m/s	12 h
Mountain waves	10–100 km	1–20 m/s	Days
Weather patterns	100–5000 km	1–50 m/s	Days to weeks
Prevailing winds	Global	5–50 m/s	Seasons to years
Climatic variations	Global	1–50 m/s	Decades and beyond
<i>Ocean:</i>			
SWOT Internal waves	1–20 km	0.05–0.5 m/s	Minutes to hours
Coastal upwelling	1–10 km	0.1–1 m/s	Several days
Conventional nadir altimetry Large eddies, fronts	10–200 km	0.1–1 m/s	Days to weeks
Major currents	50–500 km	0.5–2 m/s	Weeks to seasons
Large-scale gyres	Basin scale	0.01–0.1 m/s	Decades and beyond

**BM: Balanced motions**    **IT: Internal tides**

### Reference

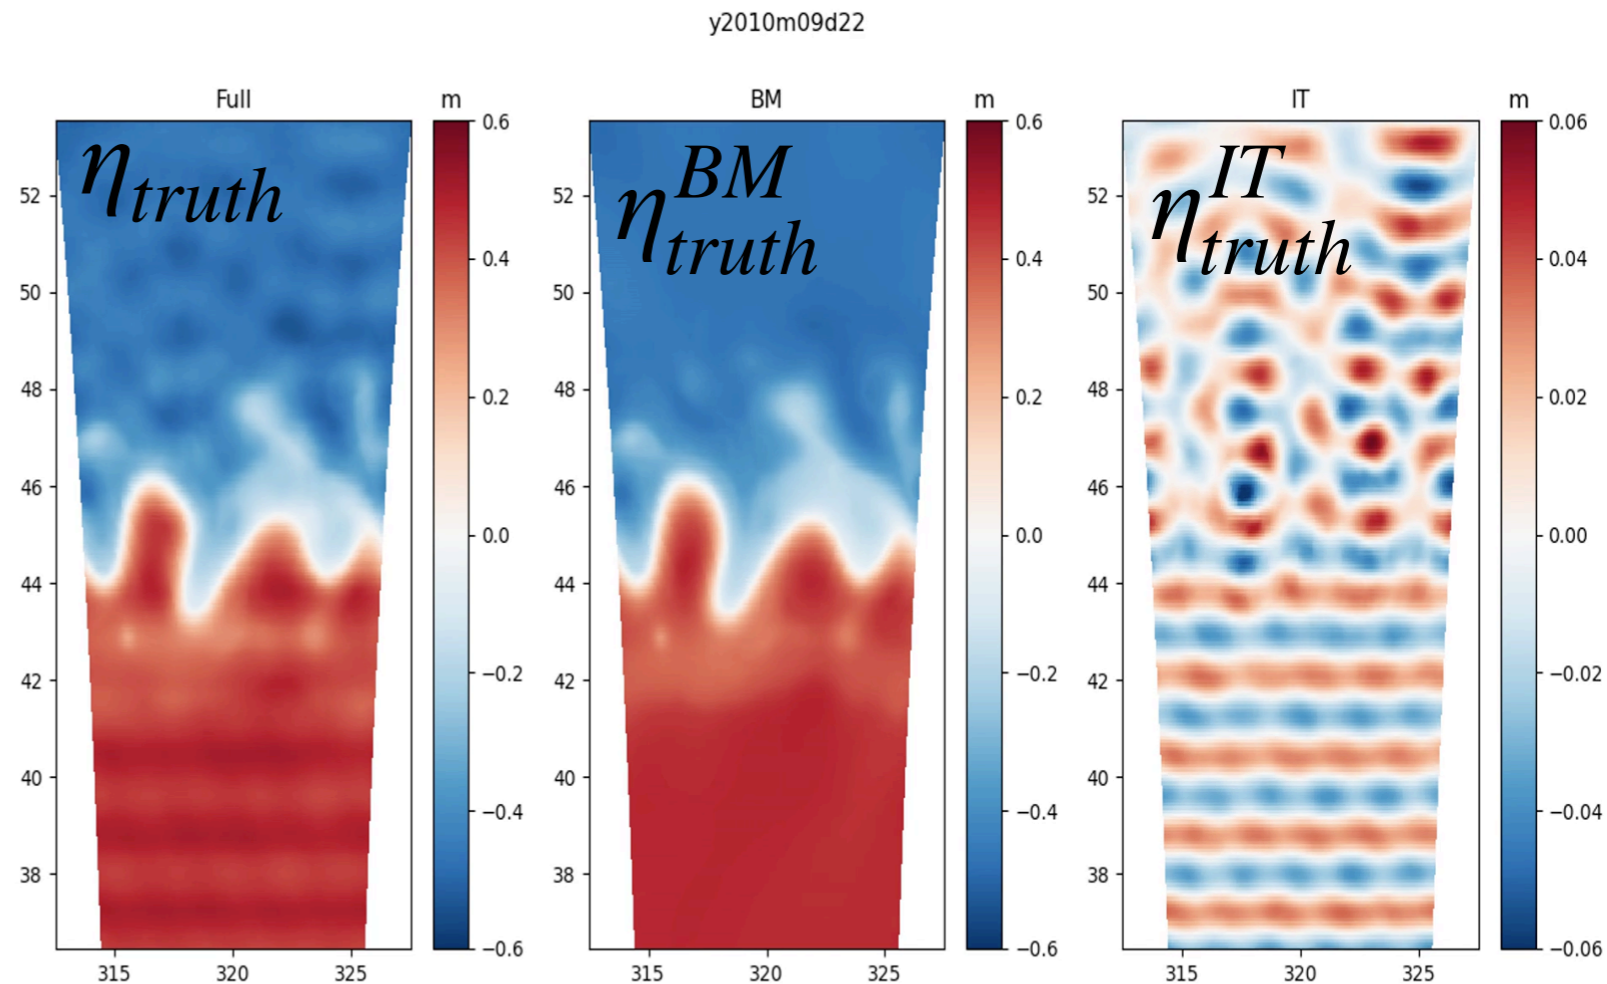

$$\eta_{truth} = \eta_{truth}^{BM} + \eta_{truth}^{IT}$$

$$\eta_{truth}^{BM}(t_0) = \frac{1}{2T} \int_{t_0-T}^{t_0+T} \eta_{truth}(t) dt$$

$$\eta_{truth}^{IT}(t_0) = \frac{1}{T} \int_{t_0-T}^{t_0+T} \eta_{truth}(t) \cdot \cos\left(\frac{2\pi}{T}t\right) dt$$

### Observation

One snapshot every 75 h (=3d+3h),  
free of noise

Simulation: Ponte et al, 2017

### BM estimation

- **Dynamics**

1.5-layer **quasi-geostrophic** model

$$\partial_t q + J(\psi, q) = 0$$

where:  $\psi = \frac{g}{f}\eta$ ,  $q = \nabla^2\psi - \frac{1}{L_R^2}\psi$

- **Data assimilation technique**

BFN, based on **nudging** equation:

$$\partial_t q + J(\psi, q) - K(q_{obs} - q) = 0$$

Le Guillou, F., Metref, S., Cosme, E., Ubelmann, C., Ballarotta, M., Le Sommer, J., & Verron, J. (2021). Mapping Altimetry in the Forthcoming SWOT Era by Back-and-Forth Nudging a One-Layer Quasigeostrophic Model, *Journal of Atmospheric and Oceanic Technology*, 38(4), 697-710.

### IT estimation

- **Dynamics**

1-layer **linear shallow water** model...

$$\partial_t u - fv = -g\partial_x \eta$$

$$\partial_t v + fu = -g\partial_y \eta$$

$$\partial_t \eta = -H_e(\partial_x u + \partial_y v)$$

...forced by **open boundary conditions**

- **Data assimilation technique:**

**4Dvar**, minimizing the cost function:

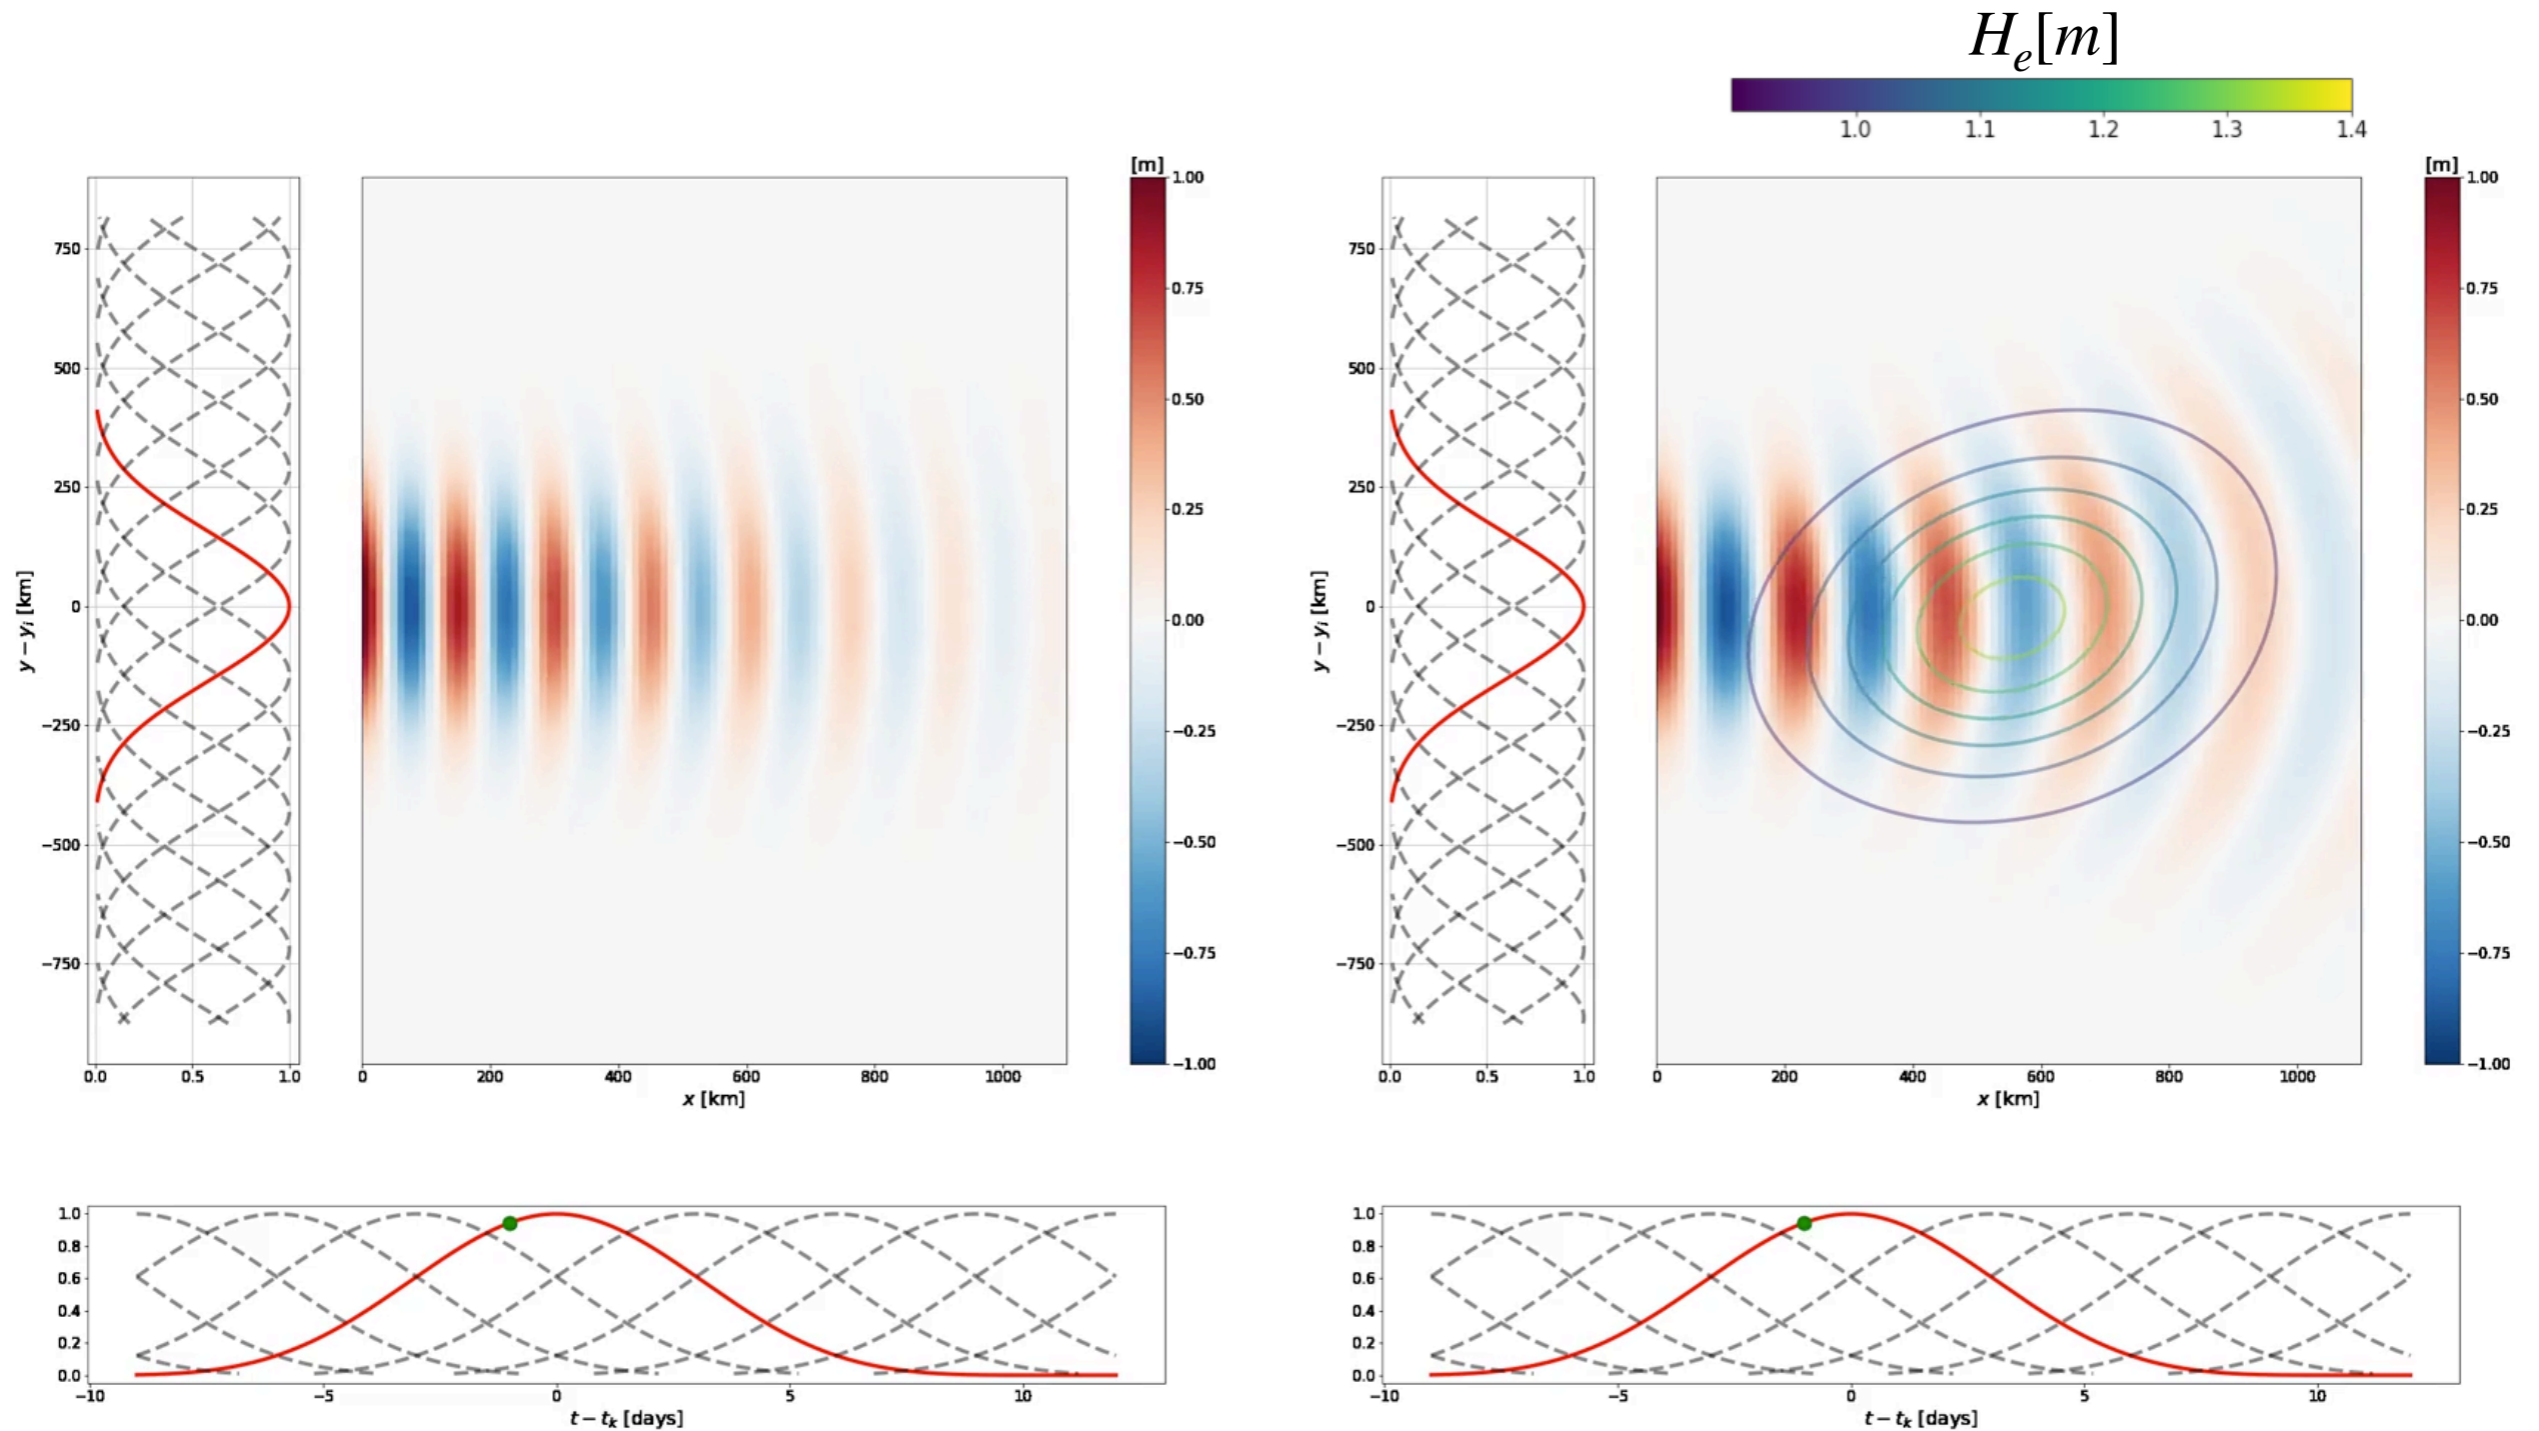

$$J(p) = ||\eta_{obs} - \eta||^2$$

where  $p$ : model parameters ( $H_e$  and boundary conditions)

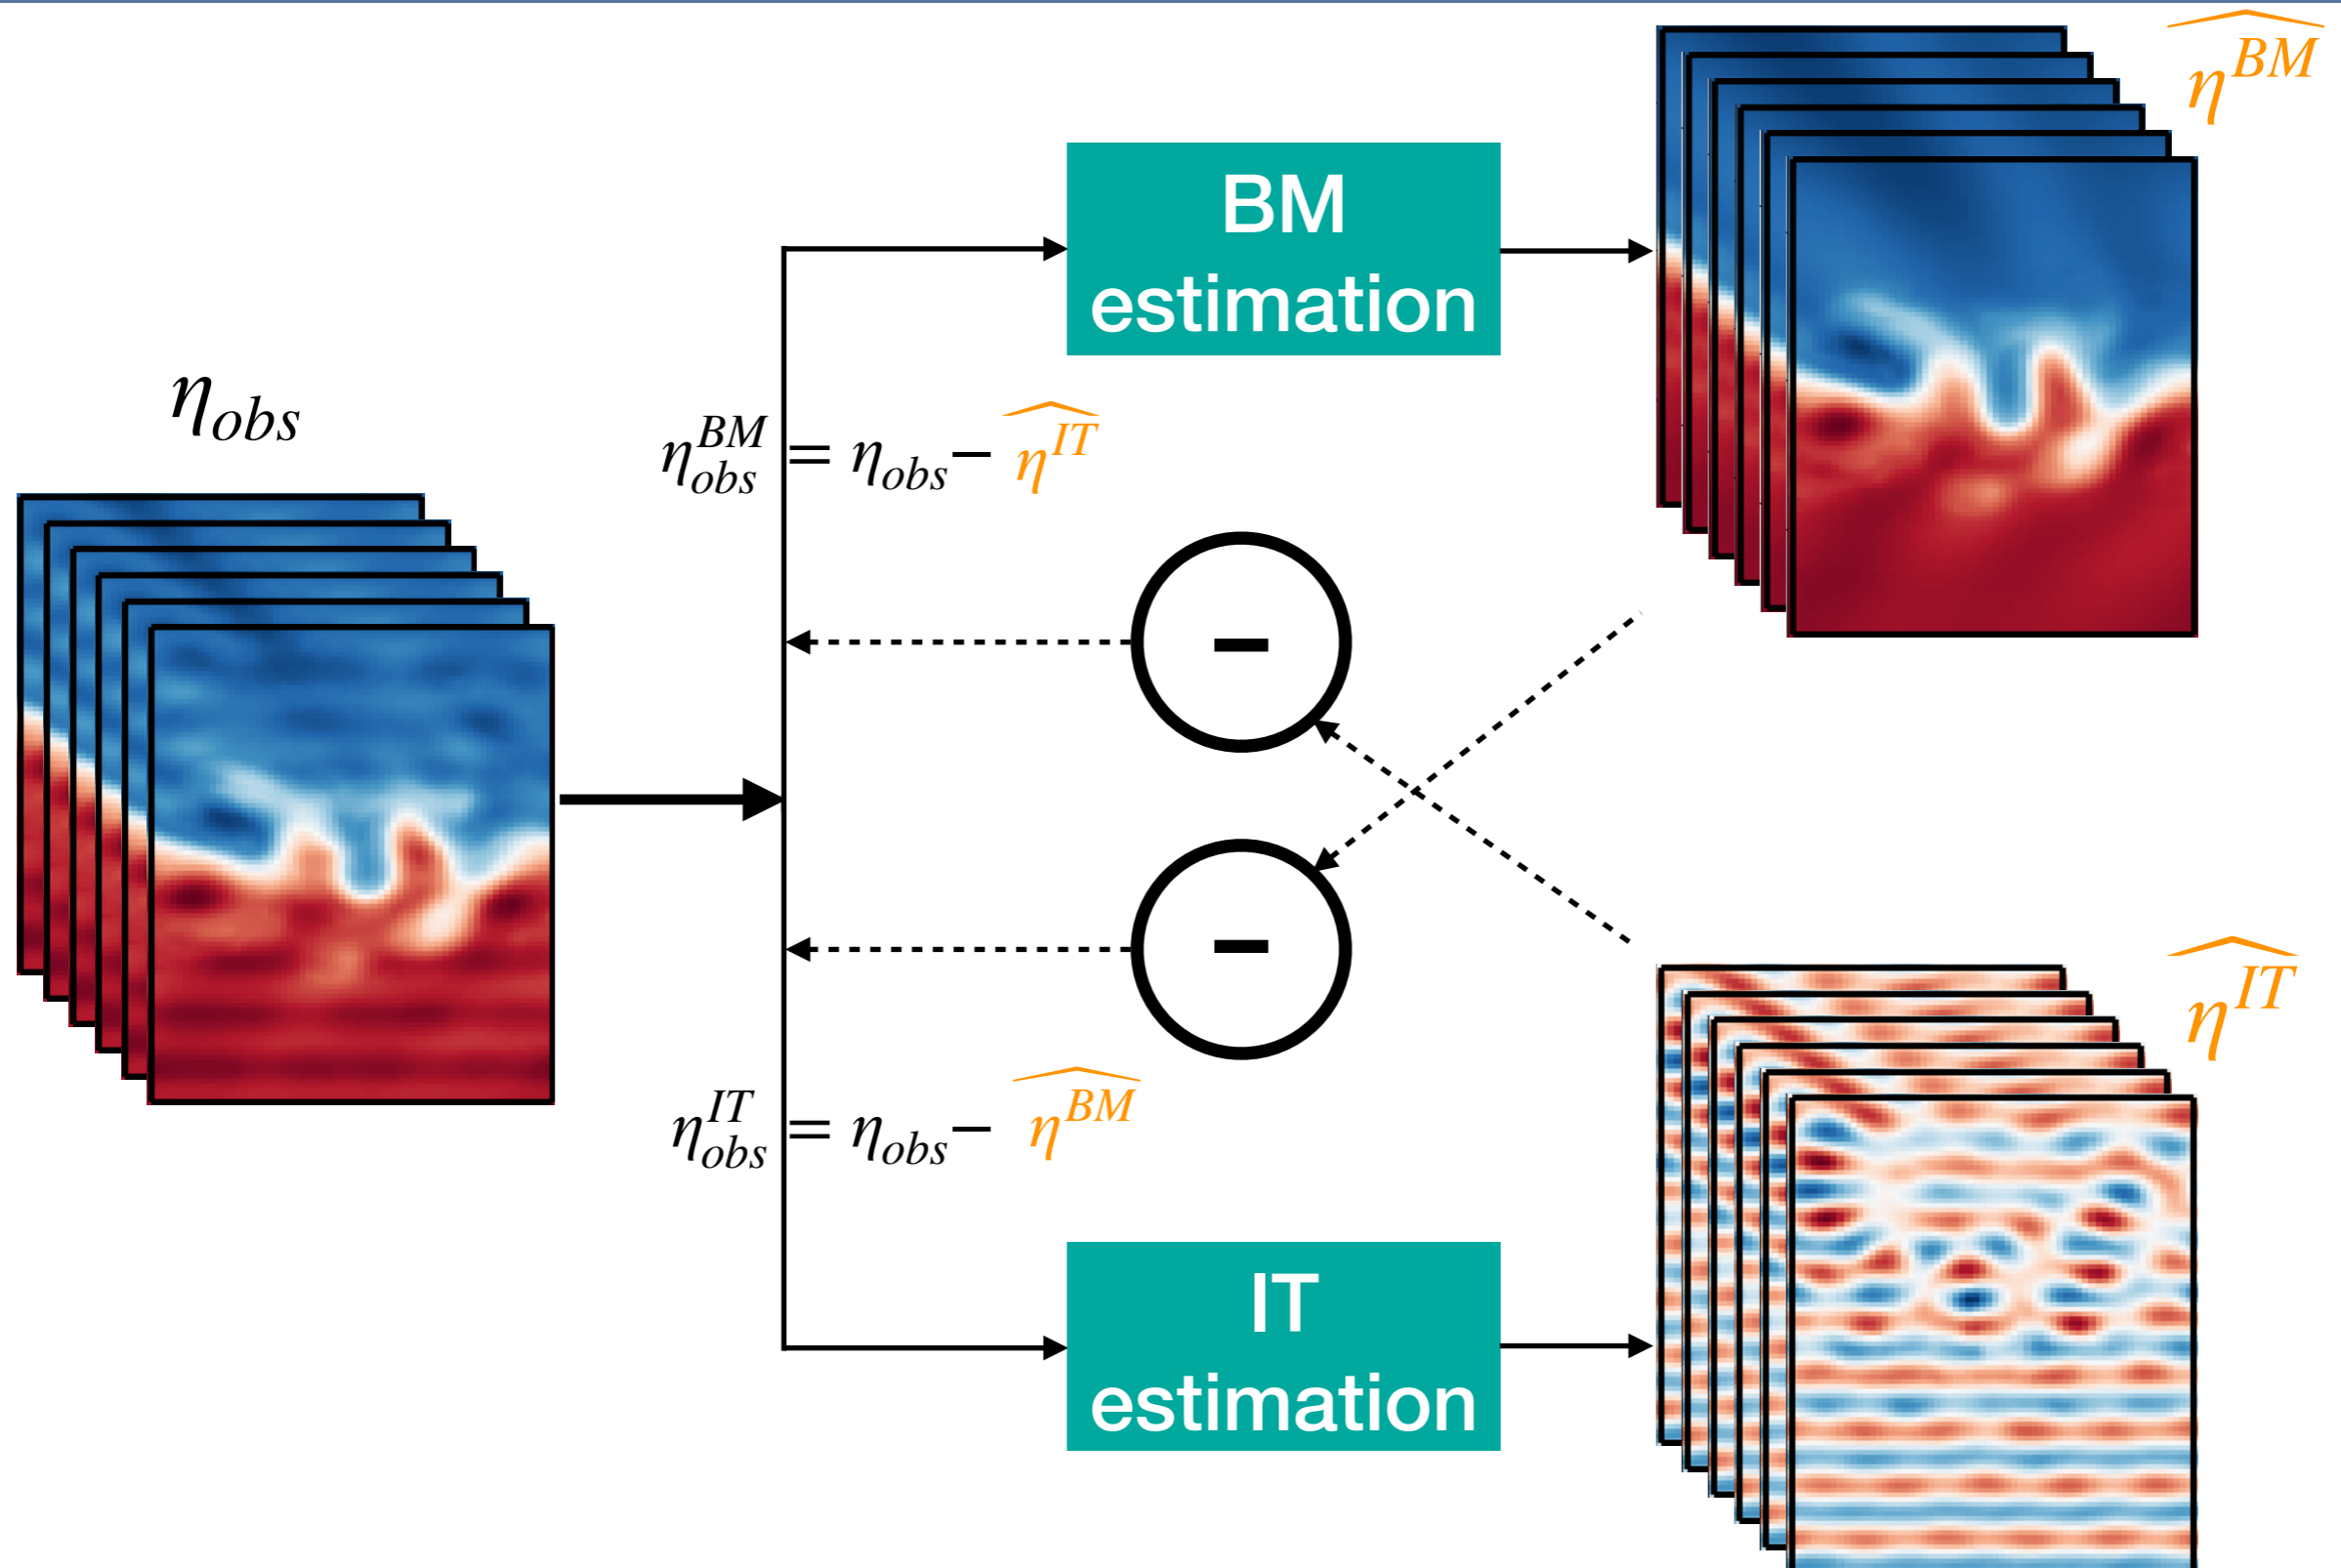

# Eddy/wave separation with a 4DVar technique

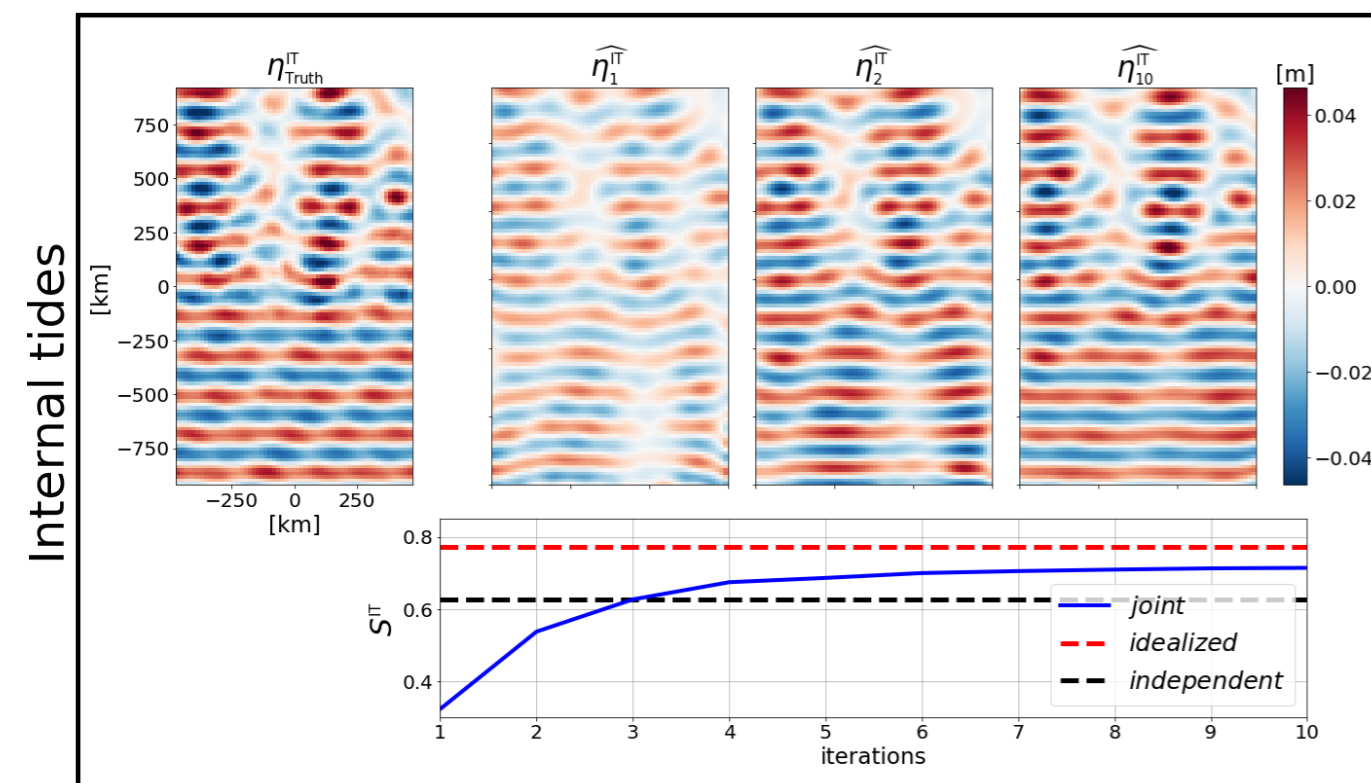

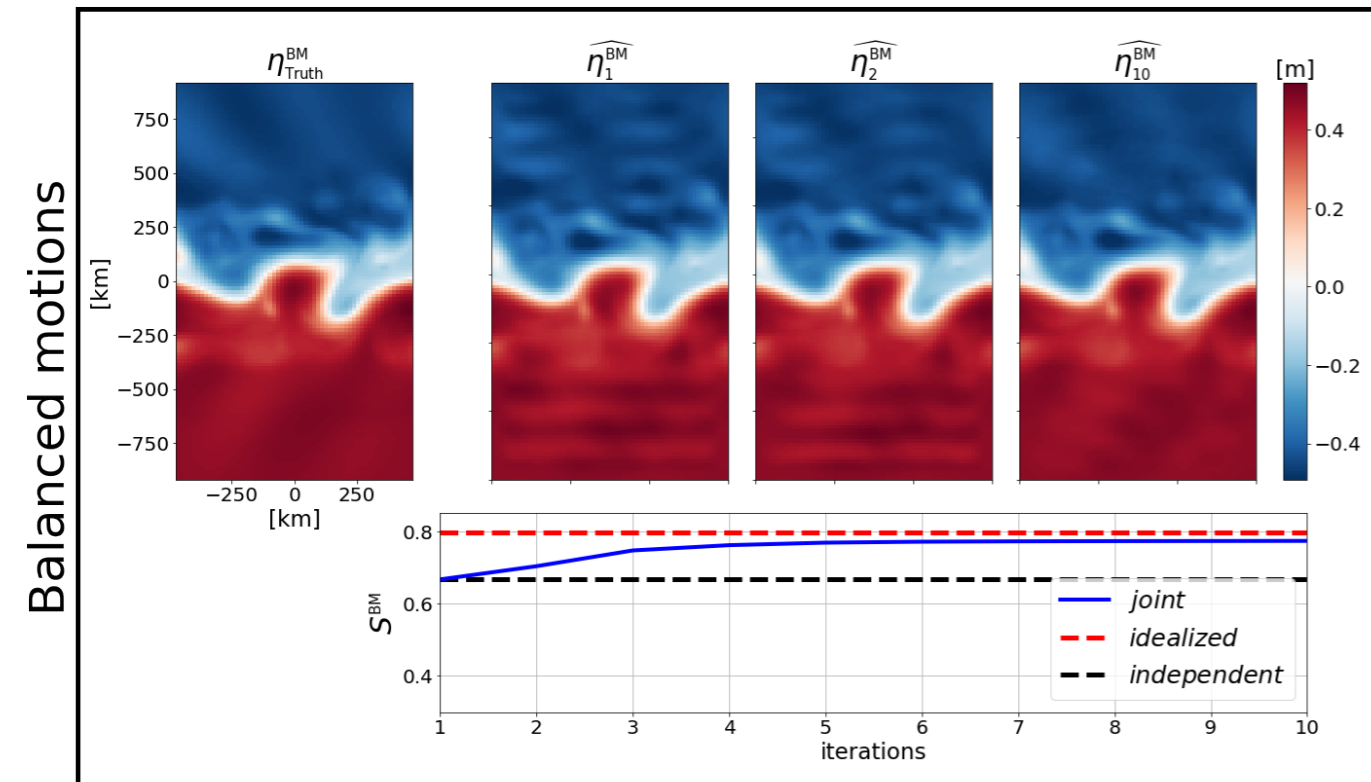

## 4DVar control parameters: illustration

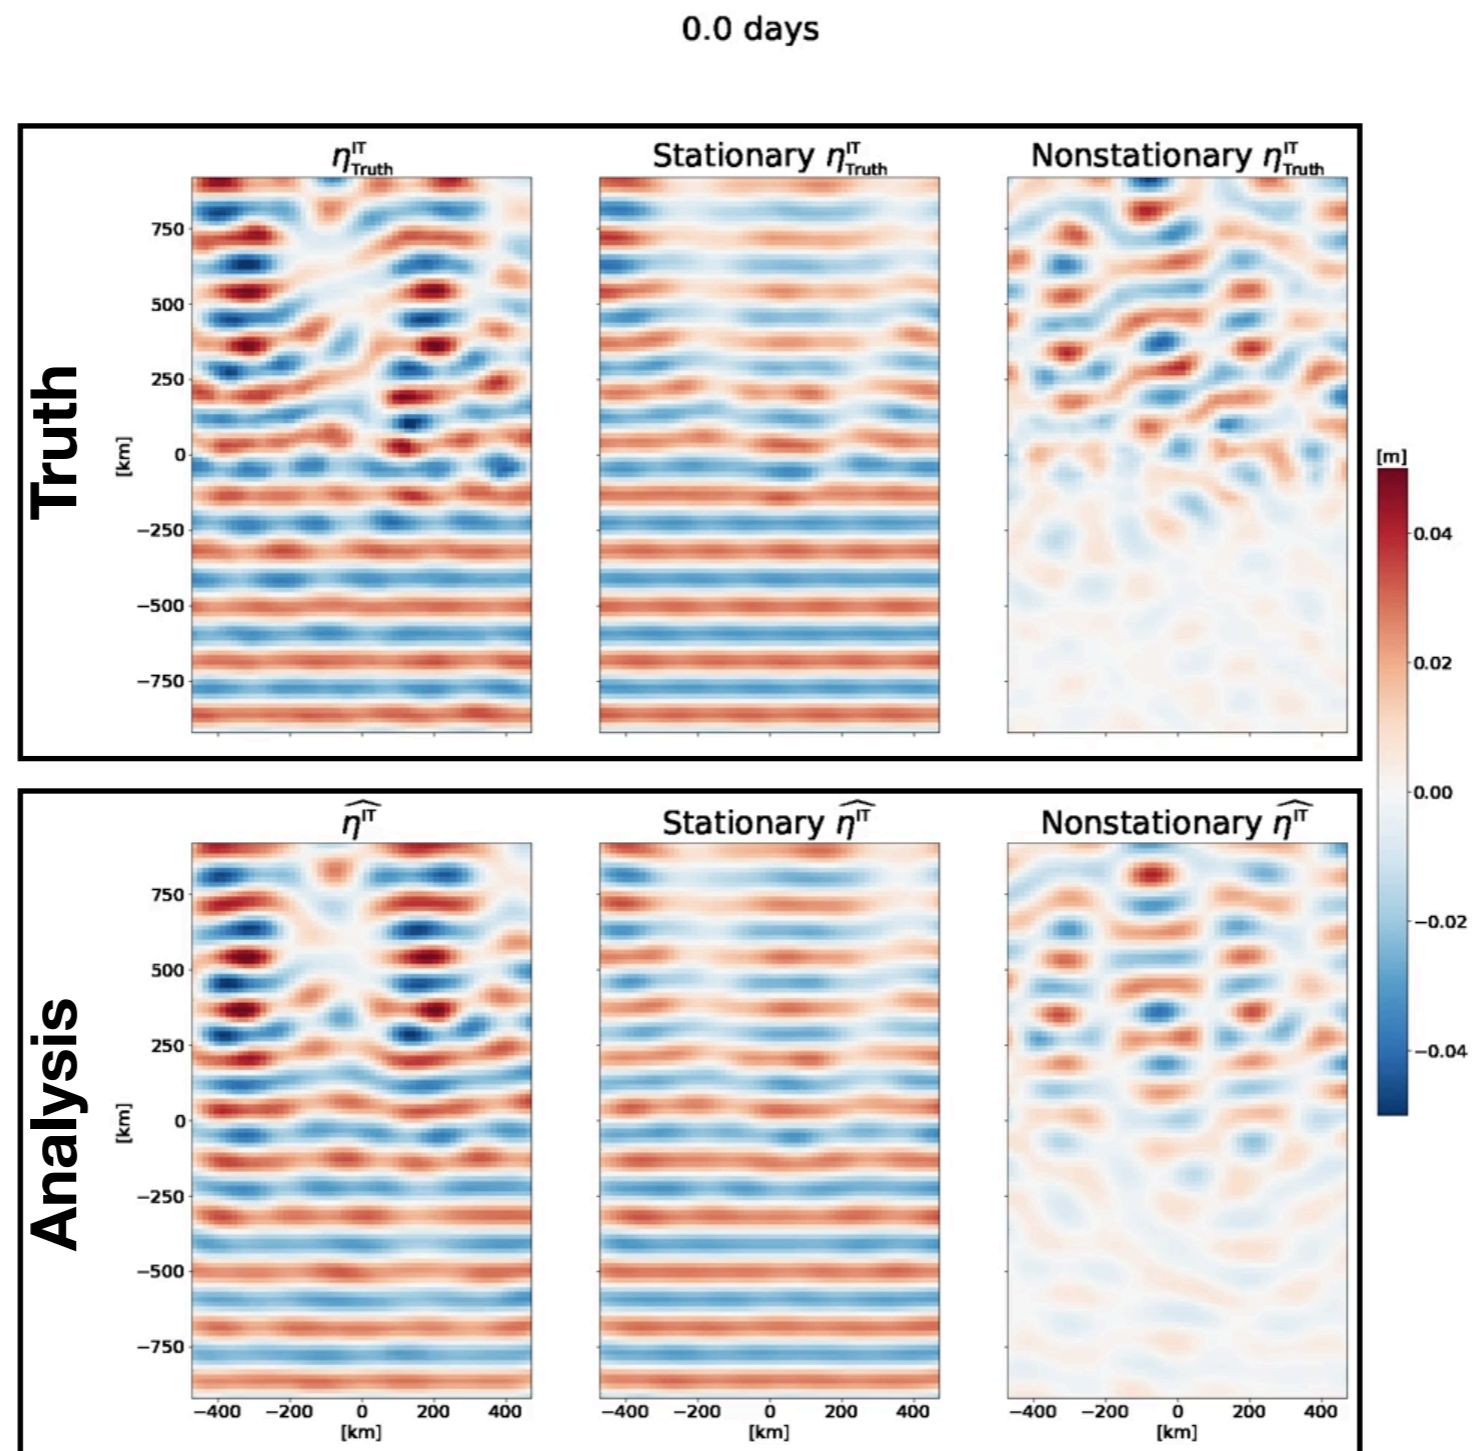

## Alternating minimization

## Results: convergence

- Convergence reached after 10 iterations.
- Throughout iterations, both components are progressively separated.
- IT estimation looks very similar to the truth
